During the persecution of the Christians which began in 1638 the paintings were largely destroyed. Those that survive include a Madonna in the Tokyo National Museum, a portrait of St. Francis Xavier, and a screen of warrior kings on horseback in the Kobe Art Museum. The importation of the religious pictures introduced for the first time in Japanese history the Renaissance type of Western painting with its emphasis on realistic description, but the influence of Western art died out after the prohibition of Christianity without making itself greatly felt in Japanese painting. There arose at the same time an interest in the customs and exotic costumes of the Western visitors, so that Western objects were used in designs of various works of art. This new type of art was generally known as *namban* or the art of the "Southern Barbarians," as Westerners were then commonly called in Japan.

The Tosa family was in decline, as was the Yamato-e that they had practiced. Tosa Mitsumoto, the master of the family, joined the Shogunate army in 1569 as official painter, and was killed in battle. The family, deprived of their master, moved from Kyoto to Sakai, a newly developed town of commerce, accompanied by Mitsumoto's disciple, Mitsuyoshi (1539–1613; VII, PL. 258). The celebrated Tosa line thus died out, and Mitsuyoshi succeeded to the house.

Minor arts. The outstanding characteristics of Momoyama craftsmanship are the lavish use of gold and silver, rich coloring, and clear, strong design. The ornaments found in the Tsukubusuma Shrine and in the Kōdaiji in Kyoto, moved from Fushimi castle, are excellent examples. The interiors of these buildings are richly colored and decorated with *maki-e*. In the Kōdaiji, in particular, there are 14 kinds of lacquerware (16 pieces in all), including chairs and kitchen utensils (see LACQUER). This type of lacquer, which is usually called Kōdaiji *maki-e*, is regarded as the finest example of Momoyama craftsmanship. Numerous other lacquered objects are preserved, among them an 8-legged table with an autumn flower design, a saddle with a reed pattern, designed by Eitoku, an inkstone case by Hon-ami Kōetsu (1558–1637; VII, PL. 336), and a reading stand (VII, PL. 339), all in the Tokyo National Museum; a dagger case with the imperial crest in the Homma Art Museum, Sakata; and a miniature writing desk in the Myōhōin, Kyoto. The most prominent workers in gold lacquer were the sons of Kōami Chosei, who had been in the employ of the Ashikaga Shogunate, namely, Chōan (1569–1610) and Chōgen (1572–1607), both of whom served Hideyoshi.

Architectural decoration and the manufacture of arms stimulated the development of metalwork. In the field of casting the *e-kagami* (hand mirror), which had come into existence toward the end of the previous period, became popular; Ao Ietsugu and Kisetsu Jōami (d. 1618) were famous makers of mirrors. Builders' hardware, temple bells, and dedicatory lanterns were made in great numbers in connection with the reconstruction of temples. The technique of casting must have been on a very high level in view of the fact that the image of the Great Buddha (destroyed by an earthquake in 1595) of the Hōkōji in Kyoto cast by Nagoshi Sanshō was larger in size than the one in Nara. The continued popularity of *cha-no-yu* stimulated the production of teakettles. Nishibayashi Dōjin and Tsuji Yojirō, under the guidance of the tea masters Takeno Jōō and Sen-no-Rikyū respectively, became master teakettle craftsmen in Kyoto; their kettles were usually called Kyō-gama (Kyoto kettles), and Kyoto gradually became the center of teakettle production.

The techniques of chasing and work in wrought gold were highly developed, and exquisite sword ornaments were produced. The three master craftsmen, Jōshin (1512–62), Kōjō (1529–1620), and Tokujō (1550–1631), were members of the Gotō family who had been in the employ of the Ashikaga Shogunate. Among the celebrated sword-guard producers were Kaneie and Umetada Myōju (1558–1631; PL. 302). Kaneie was the first to inlay sword guards with gold and silver.

Japanese pottery, which had not kept pace with the other crafts, expanded rapidly in the Momoyama period. The chief reason for this was the importance of the tea ceremony, which created a demand for articles such as tea caddies, tea bowls, and pitchers. The potters who had been engaged in the manufacture of household utensils began to produce tea objects and ornamental ceramics under the guidance of tea masters. In the Muromachi period, Japan had depended on China to supply finer glazed ceramics. As a result of the military expedition to Korea undertaken by Hideyoshi, plain and rather crude Korean pottery was imported. The birth of the *wabi* school or "tranquil" tea ceremony influenced the artistic taste of the time, and the Korean type of ware came to be appreciated and used. Native ceramics, formerly excluded from tea gatherings, now came into use at the *cha-no-yu*, and potters at various traditional sites of ceramic manufacture, Seto potters among them, recommenced the production of tea bowls. Shino ware and Oribe ware, offshoots of the Seto type, made their first appearance about this time in Gifu prefecture. In Kyoto, Raku Chōjirō improved on the Seto type and began to make raku ware, which his descendants still continue to produce. Ceramics of this school were usually called Kyō-yaki, the raku ware produced by Chōjirō's descendants being called Hon-gama, or original kiln, and those by other families called Waki-gama, or subsidiary kilns. The best-known pieces of raku ware are those made by Hon-ami Kōetsu. Hideyoshi brought back Korean potters, who stayed in and around Arita in Kyushu, where they started to produce ceramics of their own, called Arita-yaki (better known as Imari ware). The Korean influence is particularly seen in the Karatsu ware of Kyushu, and also spread to potteries around Kyoto and Osaka.

The dyeing and weaving industries, which had been on the decline, also began to flourish in these few decades, firstly because the bold decorative sense of the age found expression in gorgeous costumes and secondly because the style of costumes had changed (see COSTUME). By the end of the Muromachi period a two-piece garment had been the general rule, regardless of the sex or class of the wearer. The fashionable garment now among the samurai class, both male and female, was a short-sleeved one-piece kimono called *kosode*. Larger and more picturesque designs were employed to decorate the new-style kimono. The use of richly colored materials and bright designs, which matched the splendor of Momoyama life, appealed to the taste of the public at large. The stuffs that had been imported from Ming China in Ashikaga days, such as brocade, damask silk, satin, and thin silk crepe, were produced at Hakata in Fukuoka prefecture, Sakai in Osaka prefecture, and Nishinjin in Kyoto. These beautiful fabrics were enriched by adding embroidery, *shibori-zome* or dappled dyeing, and *suri-haku* or gold and silver foil glued to the material. The most splendid Momoyama garments, produced by a complicated process of dyeing, are the marvelous No costumes. Many of these exquisite and dainty No costumes still exist, and show how far the craftsmen of this period had advanced in their skills (IV, PL. 9).

EDO PERIOD (1615–1867). *Architecture.* In the Edo period (sometimes called the Tokugawa period) the nation was remodeled according to Confucian principles (see CONFUCIANISM), and a strictly feudal society developed. The policy of national seclusion prevented the introduction of Western civilization into Japan, and Japanese culture flourished under this protection. The characteristics of the period were the existence of two centers of culture, the old traditional capital of Kyoto and the new seat of feudal government, Edo (in 1868 the name was changed to Tokyo), and the diffusion of national culture throughout the country owing to the efforts and encouragement of the feudal lords.

Tokugawa Ieyasu rebuilt Edo castle in 1606 with a majesty suited to the headquarters of the Tokugawa government. The daimios were forbidden to have more than one castle per fief and were obliged to reduce their castles to a certain size. No additions or repairs were permitted throughout the period, and at the time of the Meiji Restoration what remained was largely in ruins so only fragments of the Edo castles survive today, as is the case with the castles and palaces of the Momoyama period. Of the daimio dwellings built in castles, only the *ninomaru* of the Nijō castle (PLS. 114, 322–324), repaired in 1626, survives in an excellent state of preservation. It follows

the *shoin-zukuri* of the previous period. There are five large buildings of similar design, built one behind the other, with a garden on a scale of unusual grandeur in front. Square pillars are used throughout the palace and the floors of its rooms are covered with *tatami* (mats), the rooms themselves being separated by fusuma. The principal rooms are gorgeously decorated and contain tokonoma, *tana*, and *shoin*. The fusuma and ceilings are adorned with paintings, and there are elaborate colored carvings in the *ramma* or frieze between the pillar and the ceiling.

In various provinces as well as Edo, feudal lords encouraged the capitals of their fiefs to be built with the castle as center. The towns were generally known as *jōka-machi* (castle cities) and were inhabited by *bushi* and *chōnin*, the merchants and craftsmen. The dwellings of the warriors were similar to those of the daimios whom they served, that is, *shoin-zukuri*. The merchants lived in single- or double-storied buildings, part of which they used for the conduct of their business. When Edo was nearly destroyed by a great fire in 1657, the government ordered rigid economy to be practiced and imposed restrictions on the construction of warriors' and ordinary citizens' houses. Few buildings of merit were erected and domestic architecture declined. But after 1703, when the merchant class gained financial control over much of the economic life of the country, wealthy merchants began to build *shoin-zukuri* houses like those of the daimios, so much so that the *shoin-zukuri* became the rule for domestic architecture of the Edo period, though more attention was paid to beautifying the interior than the exterior.

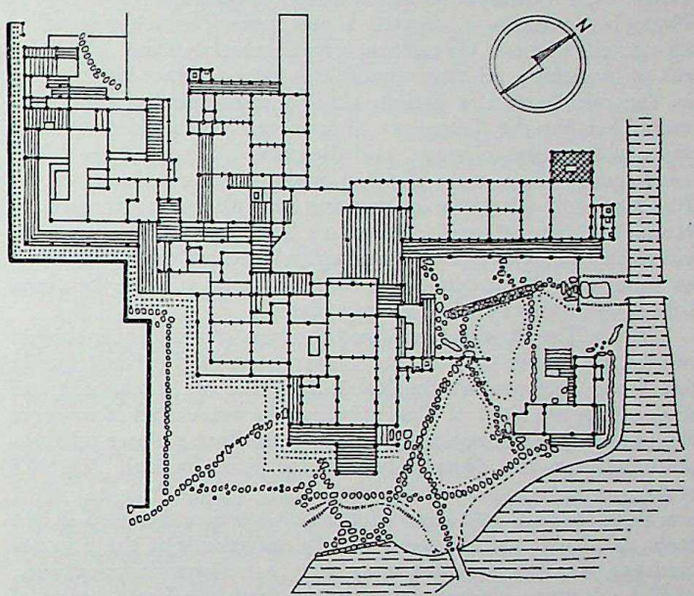
With the continuing cult of the *cha-no-yu* more teahouses of high quality were built. The most prominent of all the Edo architects was Kobori Enshū (1579–1647). The Mittan of the Ryūkōin in Kyoto and Bōsen of the Kohōan of the Daitōkuji in Kyoto, which are extant today, are believed to have been built on his design. The *chashitsu* style and *shoin* style were fused to form what is generally known as the *sukiya* style, examples of which are furnished by the three *shoin* of the Katsura palace in Kyoto (FIG. 882), the Koshoin, Chūshoin, and Shinshoin (old, middle, and new *shoin*). These domestic buildings in the new style were built as villas, the first two having been erected for Prince Tomohito before 1623 and the third for Prince Tomotada before 1643. The two teahouses in this palace, the Gepparō and Shōkintei (PL. 115), deserve mention, as do the gardens (PL. 448). The Shūgakuin palace, which was completed in 1659, consists of three summer houses and gardens, and has a *sukiya* flavor about it. In contrast to the *shoin* style, these *sukiya* buildings of the daimios and rich merchants were intended as private retreats.

Buddhist temples were not exempt from the government's rigid economic policy and in fact were not permitted to be built on a large scale; only reconstruction of buildings destroyed by fire was permitted. Among the Edo Buddhist temples that remain are the main hall of the Kiyomizudera, Kyoto (1633; PL. 311); the five-storied pagoda of the Tōji, Kyoto (1644), the highest padoga in Japan; and the Daibutsuden of the Tōdaiji (1709). A unique example of Edo Buddhist architecture is offered by the temples of the Ōbaku sect which was introduced from Ming China by the famous Chinese priest Ingen. The Mampukuji in Kyoto, headquarters of the sect, built in 1659, shows how well the style of Ming China was understood and imitated.

In Shinto architecture as well, the period followed the traditional style of the preceding ages, and this may be seen from most of the Shinto shrines in existence today, which were rebuilt in the Edo period. One exception is the development of the memorial-shrine structure, in *gongen-zukuri* (a three-part complex), the best known of which is the Tōshōgū Mausoleum of Ieyasu at Nikkō, built in 1617 and repaired in 1636. Though unsatisfactory from an architectural point of view, the whole of the shrine is executed with garish splendor and is decorated with the most elaborate ornamental detail.

Sculpture. Buddhist sculpture deteriorated even more in the Edo period than it had in the Momoyama period, while the number and kind of nonreligious carvings produced showed a marked increase.

The main reason for the decline of Buddhist sculpture was that few sculptors felt any strong inspiration to express Buddhist ideas because Buddhism itself had become formalized and petrified by ritualism. Buddhist sculptures were, however, produced in large numbers to meet the demand of temples rebuilt or repaired in this age. These were of three different kinds, and those that are preserved today may be classified accordingly: 1. Images of the Buddha produced by professional carvers in the traditional style. Works include the Shaka Triad in the Sammon of the Chionin, Kyoto, by Kōyū (1619); the Shaka Triad and the 16 disciples of the Buddha in the Sammon of the Nanzenji, Kyoto; the portrait of the emperor Shōmu by Gyōkai (1689) in the Tōdaiji, Nara; and the two images on either side of the Great Buddha by Kenkei (ca. 1726) in the Tōdaiji. 2.



Ground plan of Katsura palace at Kyoto (*after Paine and Soper*).

Some expressions of personal faith in the Buddha by nonprofessional Buddhist priests. Examples include many carvings in the Rakanji, Tokyo, such as the Shaka Triad and the images of the 500 disciples of the Buddha produced by Shōun Genkei (1648–1710) before 1695; and the Godai Myōō by Hōzan Tankai (1629–1716) created in 1701 and installed in the Hōzanji, Nara prefecture. 3. A number of highly exotic sculptures by Wan Tao Sheng, a Chinese *busshi* from Ming China, whose influence, however, did not make itself felt very much. These include the Shaka Triad and the 16 discliples of the Buddha (ca. 1668) in the Mampukuji.

Two types of nonreligious sculpture flourished: No masks and ornamental sculptures such as *okimono*, or small ornaments, dolls, and netsuke. Small figures of men, animals, and plants adorned the study and the drawing room of the homes of the samurai and townspeople. These *okimono* were produced by *busshi* and other craftsmen. Decorative dolls in clay and wood were made in various parts of the country; the most famous were the dolls of Saga, Fushimi, Gosho (Kyoto), and Nara. Netsuke were made of wood, ivory, horn, or metal and were beautifully carved in various designs; they were suspended from the girdle and held in place tobacco pouches, purses, medicine boxes (inro), etc.

Painting. The early part of the Edo period saw no marked change from the preceding age. With the establishment of a feudal society, however, and the remodeling of civil administration on Confucian ideas, new schools of art gradually arose at Edo, the seat of the Tokugawa regime, which were consonant with the interests of the different social classes. The painting of this period may be classified into three main divisions: that of the warrior class, that of the wealthy merchant class and of middle- and lower-class citizens, and that of the men of letters.

When the Tokugawa Shogunate stabilized its position Kanō Tanyū (1602–74; PLS. 353, 354) was given a residence in Edo and served the Shogunate as court painter. Tanyū was a cousin of Kanō Sadanobu (1597–1623), who had been the master of the main Kanō school (q.v.). In 1630 Tanyū's younger brother Naonobu (1607–50; PL. 355) was ordered by the Shogun to move to Edo as court artist; so was Naonobu's younger brother Yasunobu (1613–85), who had been adopted by Sadanobu as heir to the main Kanō family. Thus the Kanō school as a whole moved to Edo with the Tokugawa rulers, except for the pupils of Kanō Sanraku and some others who remained in Kyoto. With this trio — Tanyū, Naonubo, and Yasunobu — the Kanō school split up into three branches which were designated by their places of residence in Edo; the Kajibashi-Kanō, Kobikichō-Kanō, and Nakabashi-Kanō. Later, Minenobu (1662–1708), Naonobu's grandson, created a new branch which was called also by the place of his residence, the Hamachō-Kanō. The process of branching off continued in this extraordinary family until, in the middle of the period, Kanō branch families numbered 19, all serving the Tokugawa Shogunate. The 4 oldest families are usually called *oku-eshi*, and the other 15 families are called *omote-eshi*. There were also hundreds of other painters of the Kanō school, all active in painting and all calling themselves Kanō; they are generally known as Machi-Kanō or nonofficial Kanō school artists. This Kanō school became more influential as time went on and is called the Edo-Kanō school; the Kanō school of Kyoto is called simply Kanō.

It was Tanyū who formalized the type of technique, subject matter, and style that all later generations of the Kanō family followed. Interpreting the Kanō style that his forefathers had founded in the light of Confucianism, he reoriented it to serve the purposes of the regime, thus bringing about a closer relationship between the Shogunate and the Kanō school. Tanyū's style was further refined by Tsunenobu (1636–1713; PL. 355), son of Naonobu, and most of the Kanō artists followed in the steps of Tanyū and Tsunenobu. By the middle of the Edo period the Kanō school began to enjoy a nationwide popularity, and the daimios commissioned works from the Kanō artists of Edo. By this time, however, the Kanō painters had lost their freshness and inspiration. Some of the Kanō school painters rebelled against the academism and formalism of the house and founded independent schools of their own; among these were Kusumi Morikage (ca. 1680), Hanabusa Itchō (1652–1724), who was a pupil of Yasunobu, and Tani Bunchō (1763–1842). Of the Kanō school in Kyoto, Sansetsu (1589–1651), son of Sanraku, and Einō (1634–1700), grandson of Sanraku, were outstanding, but their paintings tended to formalism.

The Tosa family (see TOSA SCHOOL), who enjoyed as long a history as the Kanō family, had been in Sakai in the Momoyama period. In 1634 Mitsunori (1584–1638), son of Mitsuyoshi, went back to Kyoto. It was, however, Mitsuoki (1617–91) who reestablished the school there and was appointed E-dokoro-no-Azukari; thus the relations between the imperial court and the Tosa family, which had long been broken off, were reopened. Mitsuoki adopted the Kanō manner in fashion at that time, thus deviating from the regular Yamato-e. In the period from 1646 to 1710, from Mitsunori on, the Tosa school continued to flourish, but, as in the case with the Kanō school, their works became formalized. The Tokugawa Shogunate ordered Jōkei (1599–1670), younger brother of Mitsunori, to come to Edo as official artist in 1662. He took the family name of Sumiyoshi at the command of the emperor. Jōkei's son Gukei (1631–1705) and his descendants succeeded to the position; they were more influenced by the Kanō school than the Tosa. There was a distinct revival of the Tosa school in the 19th century under Tanaka Totsugen (1768–1823), Ukita Ikkei (1795–1854), and Reizei Tamechika (1823–64), whose works are interesting as a reaffirmation of the old Yamato-e and are better than those done by any member of the Tosa or the Sumiyoshi family.

It was the Sōtatsu-Kōrin school rather than the Tosa school that revived the tradition of Yamato-e. Tawaraya Sōtatsu, under the guidance of Hon-ami Kōetsu, created a neo-Yamato-e, mixing the decorative trend in arts of the Momoyama period and the classicism of Yamato-e. Of Sōtatsu's life nothing is known except that in 1630 he copied a picture scroll of the life of the saint Saigyō, owned by Mōri Motomichi of Yamaguchi prefecture. However, more than ten of his paintings survive, among which are a pair of folding screens illustrating the Genji Monogatari in the Seikadō Bunko in Tokyo and a pair of folding screens of the Wind God and the Thunder God (PL. 314), which are his best-known works. Sōsetsu, his younger brother, followed his brother's style. Ogata Kōrin (1658–1716; q.v.) too based his style on that of Sōtatsu. He was a member of a cultured and wealthy merchant family. Kōrin produced works on a variety of themes (PL. 315; IV, PL. 224). Among them are large pictures with richly decorative effects, such as a pair of folding screens in the Nezu Art Museum, Tokyo, depicting irises, and another pair, showing red and white plum trees, in the Atami Museum in Shizuoka prefecture. A small picture of azaleas by Kōrin is owned by Dan Inō of Tokyo. Ogata Kenzan (1663–1743; q.v.), Kōrin's younger brother, and Watanabe Shikō (1683–1755) were among Kōrin's pupils. This Sōtatsu-Kōrin school was revived in Edo by Sakai Hōitsu (1761–1828), but his works are inferior to theirs.

Other schools of painting were current in the Edo period, such as the Nanga or Southern school, the Maruyama-Shijō or Western-style painting school, and Ukiyo-e (q.v.) or popular school. As already noted, Confucianism was the official philosophy of the Tokugawa period, and deep study was devoted to both the philosophical and literary aspects of Chinese philosophy. A host of scholars of the Chinese classics arose and not only the Shogunate but a number of daimios employed official scholars. Among these scholars the Chinese way of living came into fashion; they composed Chinese poems and held calligraphy and painting in high esteem. They also admired the Nanga school of painting, which originated in China in the Ming and early Ch'ing dynasties. In the middle of the Edo period some Japanese professional painters began to produce Nanshū-ga, or pictures in the Southern style, on the models of the Chinese paintings. It was Sakaki Hyakusen (1697–1752) who founded the Japanese Nanga school and Ike-no-Taiga (1723–76) who brought it to perfection. Taiga has left a great many works, large and small, including landscapes and portrait paintings applied to fusuma and to a *byōbu* in the Henjōkōin on Mount Kōya and a landscape screen now in the Tokyo National Museum. Yosa Buson (1716–83) also deserves special mention (PL. 327); his paintings, which are combined with *haiku* (17-syllable poems), are usually called *haiga* or *haiku* pictures. Uragami Gyokudō (1745–1820), also of this school, purified Taiga's style and rendered it more subjective (PL. 329). Other Nanga artists are Kimura Kenkadō (1736–1802), Okada Beisanjin (1744–1818), and Okada Hankō (1782–1846), son of Beisanjin, in Osaka; Tanomura Chikuden (1777–1835) of Takeda in Oita prefecture and his pupil Takahashi Sōhei (1803–34) in Kyushu; Yamamoto Baiitsu (1783–1856) and Nakabayashi Chikudō (1778–1853) in Nagoya; Watanabe Kazan (1793–1841) and his disciple Tsubaki Chinzan (1801–54) in Edo.

In this period, the only outlet for foreign trade was Nagasaki and the port town flourished accordingly. It was at the same time the only inlet of advanced culture from abroad, with the result that painters of the Nanga and Western-style schools as well as scientists went to Nagasaki to study. These painters must have learned much from visiting Chinese artists, such as I Fu-chiu who came to Japan in 1720 and Fei Han-yüan who visited Nagasaki in 1734. Thus, along with the Nanga style, a new style of Ming and early Ch'ing China origin was introduced into Japan through Nagasaki (see NAGASAKI SCHOOL). Birds and flowers were chosen as subjects, and the paintings were both realistic and decorative. Kumashiro Hi (also called Yūhi and Shukukō, 1713–72) studied under Shên Ch'üan (or Nan-p'in), who came to Nagasaki in 1731. Sō Shiseki (1712–86) studied under Sung Tzu-yen (or Sō Shigan), who came to Nagasaki in 1758. Hi and Shiseki mastered the style of this school, and Kurokawa Kigyoku (1732–56) introduced it to Edo. This particular style is called the Nan-p'in school.

Maruyama Ōkyo (1733–95) of Kyoto brought this style to perfection. At first he was severely criticized by the Nanga artists, who laid stress on the literary significance of their art,

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

and by the Kanō painters, who valued Confucian ideas. Being plain and easy to understand, however, Ōkyo's works gradually came to be appreciated and understood by the merchant class until at last his school, the Maruyama school, became the center of Kyoto artists. Examples include the Hozu Rapids screen owned by Nishimura Sōzaemon of Kyoto, 90 fusuma landscapes and portraits in the Kotohiragū in Kagawa prefecture, and a pair of *byōbu* in Tokyo (PL. 327). Among Ōkyo's pupils were Komai Genki (1747–97), Hara Zaichū (1750–1837), Nagasawa Rosetsu (1755–99; PL. 329), and Yamaguchi Soken (1759–1818). Matsumura Gekkei (also known as Goshun, 1752–1811) was another of Ōkyo's pupils, but his style is more lyrical than his master's. The school he founded is known as the Shijō school. Gekkei's style was handed down through his younger brother Matsumura Keibun (1779–1843) and Okamoto Toyohiko (1773–1845). The Maruyama and Shijō schools were combined by Shiokawa Bunrin (1807–77) late in the Edo period, and this style was prevalent in much of Japanese art until fairly recently.

The influence of Western pictures that had been introduced to Japan in the Momoyama period died out soon afterward, but Western scientific books continued to enter through Nagasaki; many of these books contained copper-engraved illustrations. The artists studied these books and began to produce copperplate prints and Western-style oil paintings. Though originating in Nagasaki, oil painting was done with success at Edo by Hiraga Gennai (1726–79). Shiba Kōkan (1738–1818) and Aōdō Denzen (1748–1822) were pupils of Gennai, and they painted Japanese subjects in Western style, making use of Japanese paints, and made copperplate prints. Onoda Naotake (1749–80) and Satake Shozan (1748–85) also studied under Gennai and spread Western painting in Akita district, while Wakasugi Isohachi (1759–1805) and Kawahara Keiga (ca. 1810) were also prominent in the same school. These painters were attracted by the Western techniques of realistic description and they were interested, at the same time, in the exotic customs and manners of the Dutch. This particular school of Western-style painting, founded by Gennai, is usually called *kōmō-ga* or red-haired European-style painting, in contrast to *namban* art. This Western realism influenced Tany Bunchō and Watanabe Kazan in Edo and Maruyama Ōkyo in Kyoto, and from it they derived their naturalism.

It was in the Momoyama period, as has been observed, that the customs and manners of ordinary citizens began to be used as an independent subject of painting. This genre painting attained a still higher degree of popularity in the early part of the Edo period. The most popular subjects were Kabuki players and courtesans. A number of large paintings, including a screen showing manners and customs of the time (generally called the Hikone screen) owned by Naosuke Ii (PL. 321), represent a type of genre painting generally called "early Edo original genre painting." It is sometimes claimed that Iwasa Matabei (1578–1650) was the originator of this school and thus the founder of Ukiyo-e ("painting of the fleeting world"), but this is not correct. Matabei did produce some genre paintings, but he excelled rather in the classical style which he originated by fusing the styles of the Kanō and Tosa schools.

When the ordinary citizens became more influential in society in the middle of the Edo period, theaters and the Yoshiwara or gay quarters flourished as centers of entertainment; later, the warrior class patronized them. Celebrated actors and lovely geisha were depicted by many painters. Great masters of the early part of the period were Hishikawa Moronobu (ca. 1618–ca. 1694), who had moved from Kyoto to Edo, and Miyagawa Chōshun (1682–1752). Moronobu also made woodcuts to illustrate books on plays and the Yoshiwara. About this time Kaigetsudō Doshin produced black-and-white woodcuts of beauties, usually standing. Torii Kiyonobu (or Kiyonobu I, 1664–1729), who had been a sign painter, added the color *tan* (red) to the Ukiyo-e prints by hand; this particular type of colored print was called *tan-e*. Okumura Masanobu (1686–1764) added three colors — red, orange, and green — by hand, and he called these three-colored prints *beni-e*. Ishikawa Toyonobu (1711–85) used blocks to add colors to the black-and-white prints, adding two colors, red and green, and calling this technique *beni-suri-e*. The fully developed color print, called *nishiki-e* or brocade picture, was the creation of Suzuki Harunobu (1725–70; IV, PL. 446). The Harunobu style was carried on by Torii Kiyonaga (1752–1815; IV, PL. 448) and Kitao Shigemasa (1739–1820). The greatest exponent of *nishiki-e* was Kitagawa Utamaro (1753–1806; q.v.), who is particularly noted for his half-length portraits of women (IV, PL. 446); these are generally called *ō-kubi* or large-head pictures. It was Tōshūsai Sharaku who founded a new style in the portrayal of Kabuki players. Little is known about his life except that all his prints were made in ten months (from May of 1794 to February of 1795). Sharaku's faces are contorted by the intensity of their expressions and are highly individualized. Utagawa Toyokuni (or Toyokuni I, 1769–1825), who was influenced by Sharaku, also depicted Kabuki actors.

With the death of Utamaro (and Sharaku) the great period of Japanese prints had come to an end, and the *nishiki-e* production tended to be perfunctory until two great innovators appeared: Katsushika Hokusai (1760–1849; q.v.) and Andō Hiroshige (1797–1858; q.v.). Instead of portraying beauties, actors, or *sumo* wrestlers, Hokusai devoted himself to landscapes, thus revolutionalizing woodprinting. Of his numerous sets of prints, the finest are the Thirty-six Views of Mt. Fuji (II, PL. 30; IV, PL. 447). The other great landscape artist of Ukiyo-e, Hiroshige, excelled his predecessor. Among his works are the Fifty-three Stages on the Tōkaidō Highway (IV, PL. 447) and Scenic Attractions of Yedo (Edo). Ukiyo-e denotes woodprints produced in Edo ranging from Moronobu's black-and white prints to Hiroshige's *nishiki-e*, works that vividly reflect the life and feelings of the ordinary people.

Calligraphy. Early in the Edo period, several calligraphers of the Shōren-in school founded a new school of penmanship that was easier to write and therefore more practical. The leading calligraphers of this new style were Hon-ami Kōetsu (1558–1637), Konoe Sanbyakuin (or Konoe Nobutaka, 1565–1614), Shōkadō Shōjō (1584–1639), and Karasumaru Mitsuhiro (1579–1638). The new school, called Oie, spread among the various social classes and lasted into the Meiji period.

The Karayō, or Chinese style, was also in use at this time. The Tokugawa Shogunate supported Confucianism, and Chinese literature, including the scroll poems composed in the Muromachi period, was very popular. Chinese Zen priests, such as Ingen (1592–1673), introduced the calligraphic styles of Ming and early Ch'ing China to Japan. Throughout the Edo period, however, there were few calligraphers of real artistic skill in either the Japanese or the Chinese style, and it may be said that calligraphy did not show great improvement in quality, though it became much more widespread.

Minor arts. New styles and new types of wares were developed in this period and production increased, reflecting the demand by people of various classes. As has already been observed, there were two centers of culture at this time, Edo and Kyoto, and both developed characteristics of their own.

Kōami Nagashige (1599–1651), the son of Chōan, produced lacquered works of high quality; a shelf called Hatsune-no-tana made by him is preserved in the Tokugawa Art Museum in Nagoya. Kome Kyūi (d. 1663), like Nagashige, was employed by the Shogunate in 1626, and Kajikawa Hikobei followed him to Edo as official *maki-e* artist. The traditional styles of the three schools — Kōami, Koma, and Kajikawa — were continued with great success at Edo by the descendants of these three artists. In Kyoto, where the traditional style of *maki-e* flourished, Yamamoto Harumasa (1610–82) was the most prominent lacquer artist. Among *maki-e* craftsmen in provincial towns, Igarashi Dōho, who was in the employ of the lord of Kaga in Ishikawa prefecture, was outstanding. The style founded by Dōho is generally called Kaga *maki-e*. In the early Edo period the free shape of the works, fresh design, and simple artistry, which were characteristic of Momoyama lacquer, were brought to a higher level by the refined taste and worksmanship of the *maki-e* artists.

In the middle of the Edo period, Japan was politically stabilized under the Tokugawa regime. Civil affairs were ably managed, and the various classes participated in the cultural life. At this time some of the wealthy merchants were financially more powerful than the daimios. The love of magnificence of society in general was reflected in the forms and decorative design of lacquer ware (PL. 289), especially in *maki-e* objects where the design was executed to perfection. The masterpieces of the age are a group of landscape *maki-e* pieces in the Ōkura Museum, ascribed, with some certainty, to the official artists of the Shogunate. The collection was produced by order of the fifth Shogun, Tokugawa Tsunayoshi, and is generally called Jōkenin *maki-e*, Jōken being the posthumous Buddhist name of Tsunayoshi. Every known *maki-e* technique was employed in their production, with particular care to the details; the lavish use of gold powder and gold fittings added to the sumptuousness of the design and decoration. One artist stands out who, contrary to the trend of the times, created works of highly individual quality: Ogata Kōrin (q.v.). He was a versatile painter and, like Hon-ami Kōetsu and Sōtatsu of the Momoyama period, adapted his designs to the production of *maki-e*; he originated a style of design known as Kōrin *mōyo* (Kōrin design). Among his works are two inkstone boxes, one called Yatsuhashi in the Tokyo National Museum and the other known as Suminoe in the Seikadō Bunko in Tokyo. In contrast to these works of purely Japanese spirit, Ogawa Haritsu (1663–1747) of Kyoto produced *maki-e* works of Chinese design and technique.

Late in the Edo period the following were among the prominent artists: Koma Koryū (ca. 1780), Iizuka Tōyō (ca. 1840), Koma Kansai (ca. 1840), and Hara Yōyūsai, of Edo; Nishimura Zōhiko (ca. 1780) of Kyoto; and Tamakaji Zōkoku (1805–69) of Takamatsu in Kagawa prefecture. From an artistic point of view, however, the period showed deterioration in the production of *maki-e*; the design became overornate and the techniques formalized. The elaborate *maki-e* works applied to sword sheaths and inro show the trend of the age.

Among the schools that continue their production today are Aizu lacquer at Aizu-Wakamatsu (in Fukushima prefecture), Tsugaru lacquer at Hirosaki (in Aomori prefecture), Wakasa lacquer at Obama (in Fukui prefecture), Wajima lacquer at Wajima (in Ishikawa prefecture), and Shunkei lacquer at Noshiro (in Akita prefecture).

Metalwork also deteriorated into mannerism, emphasis being placed on elaborate detail alone. In this period, as in other periods, mirrors were produced in large quantities and the number of craftsmen engaged in this work reached several hundred. The Ao family continued to be the main mirror craftsmen in Kyoto, producing chiefly hand mirrors, which had first been made in the Momoyama period. The Gotō family, who had been patronized by the Ashikaga Shoguns and Toyotomi Hideyoshi, lived in Edo and served the Tokugawa Shoguns. The family and their pupils continued to produce metalwork in their traditional style. Yokoya Sōmin (1670–1733), one of the pupils, became dissatisfied with the Gotōs' traditionalism and created a style of his own. His method of chiseling patterns and designs on the metal surface produced effects similar to those of line drawings. Prominent among Kyoto goldsmiths were the Umetada and the Shōami schools, who inlaid sword guards with gold and silver. In the provinces, Nara Toshinaga (1673–1736) with his Nara school was prominent, and Hagi (in Yamaguchi prefecture) recorded the highest sword-guard output in Japan during the Edo period. The continued popularity of *cha-no-yu* stimulated the manufacture of tea articles, including iron kettles and garden lanterns. At the beginning of the Edo period, Nagoshi Iemasa and Ōnishi Jōsei (1603–82) moved to Edo, where they began the production of kettles. The heightened standard of living among warriors and ordinary citizens created a demand for ornamental works in metal such as *okimono*, or small ornaments for alcoves, and desk objects.

The most striking development in the crafts of the Edo period was the production of porcelain (see CERAMICS). Korean-style earthenware pottery originated at Arita in the Momoyama period, but it was not until 1616 when a Korean potter, Li San-pei (Jap., Ri Sampei), discovered porcelain clay of fine quality near

the town that Japanese potters began manufacturing *some-tsuke hakuji* or fine porcelain ware with a pure white body decorated in cobalt colors. About 1643, Sakaida Kakiemon (also known as Kakiemon I) originated a technique of producing enameled porcelains with glazed painted designs. The Arita ware made in this way had rich colors, among which red (*aka*) was often predominant, so the Kakiemon style is sometimes called *aka-e*. This ware became extremely popular. The first five masters of the Kakiemon family produced porcelains of very similar design; the sixth master, Shibuemon (ca. 1700), employed much richer designs, which have been handed down to the present day and are still made by the Kakiemon family. Arita ware was exported to China in 1646 and later to European countries through the nearby port of Imari (in Saga prefecture) and for that reason is usually called Imari ware. Kilns both in Japan and Europe were influenced by the style of the Imari ware. Another outstanding type of porcelain made in the Arita district is the Nabeshima ware; it was made in kilns at Okawachi for the Nabeshima family, lords of Saga province. The Nabeshima ware has a regularity and perfection of shape and color that is unique.

The method of manufacturing enameled procelain spread throughout the country. The earliest enameled ware was Kutani ware (in Ishikawa prefecture). *Aka-e* procelain was first produced there about 1650 but the kilns were closed about 1690 and not reopened till 1823. The earlier wares are called *ko*-Kutani, or Old Kutani (PL. 303). The later products are noted for the strength of their designs, often executed in magnificent *kinrande* (gold brocade) style.

The Seto kiln supplied the better part of the nation's demand for ceramics in this period. It was on the advice of Katō Tamikichi (1772–1824) that they changed over to the production of enameled porcelain, an art which Katō had learned at Arita.

Among the numerous potters of the age, there were two whose works may be regarded as outstanding: Nonomura Ninsei (1598–1666) and Ogata Kenzan (1663–1743; q.v.). Ninsei is particularly famous for the shapes of his ceramics and for his use of gold-sprinkling and painting in gold, techniques which he adapted from the gold lacquer designs. He was also influenced by contemporary painting and he often used Yamato-e designs; generally the colors are bright. It was Ninsei who introduced Arita enameled ware into Kyoto, which led to the application of the enameling process to Kyoto ware. Among his finest pieces are a tea pot with wisteria flower pattern (Nagao Art Gall., Tokyo), a tea pot with a mountain temple design (Nezu Art Mus., Tokyo), and a tea pot with a moon and plum tree (Tokyo Nat. Mus.). Kenzan was the disciple of Ninsei and an even finer potter; it was he who applied painted designs to raku ware (III, PL. 171).

About 1750 Kiyomizu Rokubei began to make porcelain in Kyoto, known as Kiyomizu ware, and his descendants still produce this ware. Later, Okuda Eisen (1752–1811) of this school started the production of porcelain in imitation of the enameled wares of Ming and Ch'ing China. Among his pupils were such experts as Aoki Mokubei (1767–1833), Nin-ami Dōhachi (1783–1855), and Eiraku Hozen (1795–1854), Dōhachi's pupil.

Early in the Edo period the *kosode* was worn by the whole nation — courtiers, samurai, and ordinary citizens alike — so the weaving and dyeing industries flourished. In the middle of the period longer sleeves became the fashion in women's *kosode*, as did broader obi (sashes). The people of this period desired gorgeous and elaborate decorative patterns. The Nishijin district of Kyoto, which had started production in the Momoyama period, was the center of the textile industry, but other mills were developed. As was the case with ceramics, various lords encouraged the weaving industry, and some cities and towns produced textiles of individual style for which they became famous. Many of them have continued manufacturing.

With the growth in size of the textile patterns, printed patterns came to take the place of woven designs because of the stronger effects these produced. Patterns were printed by the *chaya* process, originated by Chaya Sōri (ca. 1640) of Edo, and by the *komon* process, a special way of dyeing small patterns; both of these were employed in manufacturing the ceremonial

garments of the samurai. Later, as ordinary citizens became more and more influential, their love of ostentatious richness in dress created a demand for freer patterns. Miyazaki Yūzen (d. 1711) of Kyoto invented a special process of dyeing, the *yūzen* process, by which he could dye cloths with as much ease as if he were painting pictures on them. The *yūzen* silk fabrics are still a specialty of Kyoto.

MEIJI-TAISHO PERIOD (1868–1926). *Architecture.* The accession of the emperor Meiji to the throne in 1867 was followed immediately by the overthrow of the Tokugawa Shogunate, and this led to a complete change in Japanese government. The warriors who had been in power since the Kamakura period ceased to govern, and the new emperor, who moved his court from Kyoto to Edo (which he renamed Tokyo), reassumed direct control of the country. Edo castle, the former abode of the Tokugawas, was chosen as the new seat of the imperial palace.

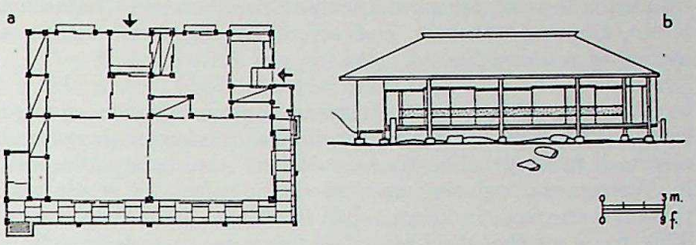
Toward the end of the Edo period commercial buildings, dwellings, and churches were built in wood for the Western residents in open ports such as Nagasaki and Yokohama; these followed, outwardly, a Western style, but Western architecture did not exert a great influence on the Japanese architecture of that period. The Meiji government, however, established a positive policy of adopting Western culture, and simultaneously displayed a great interest in town planning and in the construction of government offices in the Western manner. Employment was offered to such European architects as T. J. Waters and Josiah Conder (1852–1920) of England and C. de Boinville of France, who went to Japan between 1868 and 1877. Under their guidance, brick buildings and wooden buildings in a pseudo-Western style with plastered or stone-fronted walls and pantiled roofs were erected in big cities such as Tokyo and Yokohama. Conder was appointed professor of architecture at Kōbu University (the present Department of Technology of Tokyo University), which in 1879 turned out the first graduates to have studied Western design and building practice under the British architect. In the first 20 years of the Meiji period the Western eclectic or semi-European style made itself felt in Japan. The only surviving building of this type is the church of St. Nicholas in Tokyo, which was built on Conder's design in 1891 in a Russo-Saracen style.

Between 1887 and 1919, Japanese architects who had studied Western designs and practices in Europe erected Western-style buildings after their own plans. To celebrate the promulgation of the constitution in 1889, the government decided to build at Hibiya (Tokyo) various government offices, including a building to house the Diet. Three architects — Tsumaki Yoriki, Watanabe Yuzuru, and Kawai Kōzō — together with various construction engineers were sent abroad to study. Graduates of Kōbu University who had studied under Conder, including Tatsuno Kingo (1858–1919), and those who had studied in England and other countries joined the project. Western-style architecture constructed during this period in Tokyo, most of it in Renaissance style, includes the first building of the Bank of Japan, constructed by Tatsuno in brick and stone between 1890 and 1896; the Akasaka palace, completed in 1909, and the Hyōkeikan of the Tokyo National Museum, built in 1908, both designed by Katayama Tōyū (1854–1917); Tokyo Central Station, in brick with a steel frame, completed in 1914 on Tatsuno's plans; and the Imperial Theater built in 1911 after the plans of Yokogawa Tamisuke (1864–1945). Japanese architecture owed its sudden flowering in Western-style building to capitalism, which developed in Japan following the Sino-Japanese War (1894–95) and the Russo-Japanese War (1904–05).

Japan is subject to frequent earthquakes, and it was found that the brick and stone structures in Western style built during the first half of the Meiji period were not safe so they were replaced by earthquake-proof buildings. Steel-frame structures appeared in 1895, followed 14 years later by reinforced-concrete buildings.

Western-style buildings constructed in the Taisho period (1912–26) were chiefly large public buildings, and reinforced-concrete buildings gradually increased in number. Some American-style skyscrapers were erected. Early in the 1920's the Vienna Sezession style was introduced in Japan. The principal extant buildings of this period, all in Tokyo, are the Kaijō building, erected after designs by Tatsuno in 1919; the Marunouchi building, designed by the Mitsubishi Real Estate Department, 1923; the art gallery of the Meiji Shrine, built in the same year; Frank Lloyd Wright's (1869–1959) Imperial Hotel, completed in 1922; and the Department of Technology of Tokyo University buildings, completed in 1923 after plans of Uchida Shōzō (b. 1885), where steel window sashes were used for the first time in Japan.

Shinto shrines, Buddhist temples, and domestic architecture continued in the Meiji period to be built of wood in the tradi-



Ground plan and elevation of a typical house.

tional manner. Two examples of wooden structures of this period are various buildings of the Higashi Honganji in Kyoto, rebuilt between 1880 and 1895, and the Heian Shrine in Kyoto, built in 1895. The residences of the nobility and the wealthy class were mainly of *shoin* style, with some rooms in a semi-European style.

In the Meiji period the construction of gardens of traditional design and taste was discontinued; after 1873 many gardens were turned into public parks. In the Showa period (after 1926) Western-style gardens were imitated, and some Japanese gardens were built.

Sculpture. In the Meiji period Buddhist sculpture was no longer made owing to the anti-Buddhism of the government, and Japanese sculpture was at a low ebb in this period. Only the miniature art of the netsuke, made of wood, bone, and ivory for the export trade, was produced. Western-style sculpture was studied in the early part of the Meiji period (when European culture was absorbed with little understanding or criticism on the part of the Japanese). In 1876 the government ordered a school of art to be built at Kōbu University. Vincenzo Ragusa (1841–1928), an Italian, was invited to the university to give lessons on Western art; he introduced the art of plaster modeling, and gave instructions on architectural decoration, such as marble statues and plaster busts. Before this new type of sculpture was fully assimilated, however, a nationalistic current arose, which led to a revival of interest in traditional wood carving. When the Tokyo Academy of Fine Arts was founded in 1888, two professional sculptors of the traditional school were appointed professors in the sculpture department: Takeuchi Kyūichi (1857–1916) and Takamura Kōun (1852–1934).

Japanese sculptors specializing in Western-style carving, however, continued to find favor. Ōkuma Ujihirō (1856–1934) was a pupil of Ragusa; Sano Akira (b. 1866) and Naganuma Moriyoshi (1857–1942) studied in Italy. The latter was appointed professor in the sculpture department of the Tokyo Academy of Fine Arts in 1899, when sculpture was included as an independent subject in the curriculum. In 1902 he was awarded the gold medal at the international exhibition in Paris for a work in Western style. Two years later, Shinkai Taketarō (1868–1927) returned from Germany after completing his studies there. Thus the new Western-style school flourished at the same time as traditional sculpture in wood.

In 1907 the Ministry of Education held for the first time an over-all exhibition of fine arts under government management; both Japanese sculpture and Western-style carvings were exhibited. Western-style sculpture gradually came to be understood and appreciated by the general public. Prominent among

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

the sculptors of this school are Asakura Fumio (b. 1883) and Ogiwara Morie (1879–1910). In 1914 the Nippon Bijutsuin, or Japanese Academy of Fine Arts, was reestablished in opposition to the government-operated exhibition; among the members of this organization are Hiragushi Denchū (b. 1872), Ishii Tsuruzō (b. 1887), and Tobari Kogan (1882–1927). Also in 1914 a group of Western-style painters organized the Nika-kai. In 1919 a Western sculpture department was created in the Nika-kai, with Fujikawa Yūzō (1883–1935) a leading member. He had been an assistant of Rodin, and when he introduced some of the master's works to Japan the influence on Japanese sculpture was considerable. The Teikoku Bijutsuin, or Imperial Academy of Fine Arts, was established by the Ministry of Education in 1919; among the sculptor members were Takamura Kōun, Shinkai Taketarō, and several Western-style sculptors including Asakura Fumio.

Painting. The policy of extreme Europeanization adopted by the Meiji government in an effort to modernize Japan and elevate it to the level of Western nations stimulated an interest in Western oil painting and woodcuts, with the result that these became more influential than traditional Japanese painting. This trend of the Meiji period led Japanese artists to follow traditional Japanese and Western styles (treated separately below) without being able to fuse the two. When the imperial palace and the government were established in Tokyo in 1869, Tokyo became the artistic center of the nation.

a. Traditional-style painting. Toward the end of the Edo period the Maruyama-Shijō school was the center of artistic life in Kyoto; many of the artists of this school were active in the first 20 years of the Meiji period and were strongly influenced by Western realism. Among them were Mori Kansai (1814–94), Kishi Chikudō (1826–97), and Kōno Bairei (1844–95). In these first 20 years, some pupils of Kōno Bairei were active: Kikuchi Hōbun (1862–1918), Takeuchi Seihō (1864–1942), and Tsuji Kakō (1870–1931). At this time a reaction against extreme Europeanization set in, and a movement to reevaluate traditional Japanese painting was started. Young artists, including Takeuchi Seihō (PL. 330), after various experiments successfully introduced a new style of Japanese painting, adapting traditional elements to modern requirements. Thus in the latter part of the Meiji period the traditional style was revitalized.

The principal painters active in the Taisho period were Uemura Shōen (1875–1949), a woman painter, Nishiyama Suishō (1879–1958), Hashimoto Kansetsu (1883–1945), Tsuchida Bakusen (1887–1936), Kikuchi Keigetsu (1879–1955), Tomida Keisen (1879–1936), and Murakami Kagaku (1888–1939). They assimilated the spirit of Western painting and fused it with the classical style of Japanese painting, deriving their modern Japanese style from that of Takeuchi Seihō. Entirely independent of the main group of Kyoto painters was Tomioka Tessai (1836–1924), an exponent of the Nanga school who developed a unique style. In the latter half of the Edo period the Nanga painters had lost their originality and become coarse, but Tessai breathed new life into the old forms. He successfully expressed an unworldly spirit in his painting, combining with it his Chinese classical culture. His works were the last glory of Nanga painting.

Unlike the Kyoto school, several groups, led by the Kanō school, made up the artistic world of Tokyo. In the first half of the Meiji era, the following artists were outstanding: Kikuchi Yōsai (1788–1878) in Nanga painting, Taki Katei (1830–1901) of the realist group, Tsukioka Yoshitoshi (1839–92) of Ukiyo-e, and Kanō Hōgai (1828–88; PL. 356) and Hashimoto Gahō (1835–1908) of the Kanō school. Ernest Fenollosa (1853–1908), an American scholar who went to Japan in 1878 to teach philosophy at the university in Tokyo, was instrumental in arousing the interest of the Japanese in their ancient arts just at the time they tended to reject them for European styles. The movement for the revival of traditional Japanese arts which arose about 1882 became more concrete with the training of artists and research into ancient works of art conserved in old Buddhist temples and Shinto shrines. Vigorous advocates of this movement were Fenollosa and Okakura Tenshin (also called Okakura Kakuzō, 1862–1913). Okakura Tenshin became the president of the Academy of Fine Arts in Tokyo, founded in 1888, and Hashimoto Gahō and Kawabata Gyokushō (1842–1913) were appointed professors of Japanese painting.

In 1898 Okakura Tenshin resigned because his views on the administration of the school were rejected, and set up the Nippon Bijutsuin in opposition to the governmental organization with Hashimoto Gahō and some of the first graduates of the Academy of Fine Arts, including Yokoyama Taikan (1868–1958; PL. 330), Shimomura Kanzan (1873–1930), and Hishida Shunsō (1874–1911). In their new, romantic Japanese painting emphasis was laid not on line, as in the Kanō school, but on the choice of subject matter according to interpretations derived from modern thought. Some critics contemptuously called this new style the Mōrō school or ultraimpressionism. Thus the first part of the Meiji period was a time of antagonism between the Academy of Fine Arts and the Nippon Bijutsuin.

At the first art exhibition held in 1907 painters of the Nippon Geijutsuin group took part; however, in 1914 Yokoyama Taikan severed his connection with the government-managed exhibition and together with Shimomura Kanzan, Imamura Shikō (1880–1916), and Yasuda Yukihiko (b. 1884) he reestablished the Nippon Bijutsuin, which is still a private circle of artists in opposition to the official group.

Prominent among the faculty members of the Tokyo Academy of Fine Arts were Kobori Tomone (1864–1931), Terasaki Kōgyō (1866–1919), Kawai Gyokudō (1873–1957), and Matsuoka Eikyū (1881–1938). Kaburagi Kiyokata (b. 1878), Kikkawa Reika (1875–1929), Hirafuku Hyakusui (1877–1933), and Matsubayashi Keigetsu (b. 1876) were among painters who, without belonging to any group, displayed their works at the government-managed exhibitions. Among the newly enlisted members of the Nippon Geijutsuin were Kobayashi Kokei (1883–1957), Maeda Seison (b. 1885), Ogawa Usen (1868–1938), Kawabata Ryūshi (b. 1885), and Hayami Gyoshū (1894–1935). The Kanten circle or the Tokyo Academy of Fine Arts group was academic and conservative in style, whereas the Nippon Bijutsuin group was progressive, always ready to improve and undertake new experiments. Various techniques, styles, and designs of different schools existing in the first half of the Meiji period were now brought together: the Kanō school and the Maruyama-Shijō school were entirely consolidated in the Taisho period, the Yamato-e and Nanga painters became small branches, and the Ukiyo-e died out. Nevertheless, the problem of how much of Western artistic culture to incorporate into Japanese art remained unsolved.

b. Western-style painting. The history of Western painting in Japan may be divided into three stages: the *namban-ga* of the Momoyama period, the *kōmō-ga* of the latter half of the Edo period, and the Western painting introduced at the beginning of the Meiji period.

Charles Wirgman (1832–91), who went to Yokohama as special correspondent of the *Illustrated London News* at the end of the Edo period, introduced regular Western painting, or oil painting, into Japan. Among the earlier oil painters were two pupils of Wirgman's, Takahashi Yuichi (1828–94) and Goseda Yoshimatsu (1855–1915). Later, two Italians, Edoardo Chiossone, a painter (1832–98) who went in 1875, and Antonio Fontanesi (1818–82) who went the following year and taught painting at the Academy of Fine Arts, helped to spread the techniques of oil painting. Among the painters who had studied abroad were Kunizawa Shinkurō (1847–77), who returned to Japan from England in 1875, and Kawamura Kiyoo (1852–84), who came back from Europe and America in 1881. In 1888 Asai Chū (1856–1907), who had studied under Fontanesi, and Kawamura Kiyoo set up the Meiji Bijutsu-kai, the first of its kind in Japan, and held an exhibition. Kuroda Kiyotern (1866–1924), who had studied plein-air painting under Raphaël Collin (1850–1917), and Kume Keiichirō (1866–1934) returned to Japan in 1893 and joined the Meiji Bijutsu-kai. Three years later these two artists set up a separate group of painters called Hakuba-kai and simultaneously were appointed professors of

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

Western painting, a new subject added to the curriculum of the Tokyo Academy of Fine Arts. The Meiji Bijutsu-kai was renamed the Taiheiyō Gaka in 1902 and lasted into the Showa period; this association, together with the Hakuba-kai (renamed the Kōfū-kai in 1909), supported the Kanten group and represented Western painting in Japan during the latter half of the Meiji period. The Hakuba-kai, led by Kuroda Kiyoteru, was the chief force behind the art exhibition held in 1907; consequently, their plein-air style came to be identified with academism in Japanese Western painting.

Dissatisfied with the academism of the Kanten group, in 1912 Takamura Kōtarō (1883–1956) and some other artists organized a private association, inspired by their admiration of the Fauves, called the Fusain Society. Two years later another private organization called the Nika-kai was set up by Ishii Hakutei (1882–1958), Sakamoto Hanjirō (b. 1882), Kishida Ryūsei (1891–1929), and others, followed eight years later by the Shunyō-kai founded by Umehara Ryūzaburō (b. 1888) and others. Efforts were made by all these painters to absorb as best they could the various European movements after the Fauves, such as cubism, futurism, Dadaism, surrealism, and expressionism. The Kanten group, on the other hand, showed signs of deterioration in this period; its principal artists were Fujishima Takeji (1867–1943), Okada Saburōsuke (1869–1939), and Wada Eisaku (1874–1959), all professors at the Tokyo Academy of Fine Arts.

Minor arts. Following the restoration of imperial rule in 1868 there was a decline in the minor arts for a short period. In 1873 some Japanese products were displayed at the World's Fair in Vienna; the exhibit created a demand for Japanese works, thus stimulating the production of works of art for export. The first exhibition held in Japan in 1877 testified to the gradual revival of the crafts in the country, and much credit must be given to the German craftsman Gottfried Wagner (1830–92), who went to Japan in 1868. It was he who taught Japanese artisans the true worth of the crafts, at the same time introducing new techniques of Western industrial arts.

With the national development, the growth of capitalism, the establishment of crafts departments in newly founded schools of fine arts, public and private, and the success of Japanese craftsmen at the World's Columbian Exhibition in Chicago (1893) and at the Exposition Universelle in Paris (1900), Japanese crafts were gradually recognized as being on the same level as other branches of fine arts such as painting and sculpture. In the Taisho era, under the influence of the new Western art movements, Japanese craftsmen were faced with the question of how their traditional crafts were to adapt themselves to the Western style.

Most of the creations in metal in the Edo period had been small pieces requiring elaborate workmanship and skill, objects mainly for the decoration of swords. The metalworkers were hard hit by the decree abolishing the wearing of swords, but new techniques and designs were devised to make up for the loss, both in the production of articles for export and for home consumption. Leading craftsmen in the art of metal-chasing were Kanō Natsuo (1828–98), Unno Shōmin (1844–1915), and Tsukada Shūkyō. Hata Zōroku (1823–90) and Katori Hozuma (1874–1954) were outstanding in casting techniques. In the field of wrought gold Suzuki Chōō (1848–1919), a traditional master artisan, and Eiichi (b. 1876), who adapted the traditional technique to the new spirit of the age, were distinguished craftsmen.

Lacquerwork also, after a period of decline similar to that of metalwork, revived. Shibata Zeshin (1807–91), a painter and master lacquerer, produced beautiful lacquerwork in the early part of the Meiji period; Ogawa Shōmin (1847–91) of the Kōrin school and Kawanobe Itchō (1830–1910) of the Kōami school were noted artisans in the traditional style. Other lacquerers added new tones of colors and applied lacquer to objects that had not hitherto been included in *maki-e* production; among these Umezawa Ryūshin (1874–1955) and Rokkaku Shisui were prominent.

Japanese ceramics were displayed for the first time at the World's Fair in Vienna in 1873, and from then on ceramics were represented at exhibitions abroad. Artisans introduced Western techniques and designs, thus stimulating the production of new types of ceramics. Prominent among the potters of this period were Itō Tōzan (1846–1920) and Mashimizu Zōroku (1822–77) of Kyoto and Miura Ken-ya (1821–89) of Tokyo, who worked in the traditional style, and Takemoto Hayata (1848–92) and Suwa Sozan (1852–1922) of Tokyo, who originated a new style by combining Western design with traditional Japanese techniques. These types tended to become formalized in the Taisho period. Numata Kazumasa (1873–1954) introduced sculpture in ceramic, which he had learned to make in the Sèvres works in France; Itaya Hazan (b. 1872), after studying European enamels, succeeded in creating a new color.

The true cloisonné (*shippō*) enamel, which had appeared in the Edo period, achieved a remarkable development, stimulated by large demands from overseas. Kaji Tsunekichi (1803–83) of Aichi prefecture created a lined cloisonné enamel. Namikawa Yasuyuki (1845–1927) of Kyoto created a translucent type. Namikawa Sōsuke (1847–1910) opened a new cloisonné enamel factory in Tokyo.

The dyeing and weaving industries also developed gradually under the influence of Western designs and practices. Date Yasuke (1844–92) of Kyoto went to the 1873 World's Fair, and also studied the chemical dyeing processes in Germany and France. He brought a Jacquard apparatus from France to Japan. In 1887 Kawashima Jinbei (1853–1910) of Kyoto went to France to study at the Gobelin tapestry works. The Nishijin weavers of Kyoto began to produce large tapestries, adopting Western techniques, with embroidered figures in traditional Japanese style.

Small ivory and bone carvings were made by Ishikawa Kōmei (1852–1913) and Asahi Gyokuzan (1841–1923), among others. The demand for netsuke by foreigners declined, and netsuke production ceased in the Taisho period. Bamboo vessels and utensils used in arranging flowers and in the tea ceremony continued to be produced in the Meiji period; the style was like that of the Edo period.

SHOWA PERIOD (1926). *Architecture.* The great earthquake disaster that occurred in the Kantō district in 1923 destroyed practically all the buildings in and around Tokyo. It was after this catastrophe that the true worth of Western earthquake-proof and fireproof buildings was widely recognized and European architecture was adopted on a grand scale in the Showa period. After 1926 the influence of Walter Gropius, Le Corbusier, and Otto Wagner was felt in Japan. Antonin Raymond (b. 1889) of Czechoslovakia accompanied Frank Lloyd Wright to Japan, and in 1921 he opened his own office; he has exerted a deep influence on contemporary Japanese architecture. Buildings of this time in Tokyo are the Yasuda Assembly Hall and the library of Tokyo University by Uchida Shōzō (1925) and the Kiyosu and Eitai bridges, designed by the Bureau of Reconstruction (1928). Attempts were also made to combine the styles of Japanese and other Oriental architecture with that of the West. The Kabuki Theater (1922) by Okada Shin-ichirō and the Tsukiji Honganji (1934) by Itō Chūta, both in Tokyo, are two examples of this.

In the 1930s the following buildings were erected in Tokyo: Central Post Office by Tetsurō Yoshida (1931); National Diet Building (completed 1936); Communications Hospital by Mamoru Yamada (1937), built of concrete with large windows and projecting verandas on the sides; the chapel of the Women's University by Antonin Raymond (1938); and the Daiichi Sōgo Building by Watanabe Hitoshi and Sugimoto Kōsaku (1938). In Osaka the Sogō Department Store by Tōgo Murano (1936) and the Central Post Office by Tetsurō Yoshida (1939) are notable.

Soon, however, the spirit of nationalism reasserted itself, and official architecture became massively solid and martial in appearance, with the buildings statically juxtaposed. The Army Palace in Tokyo is an example of this style.

Very few buildings were erected on a large scale during the Sino-Japanese conflict of 1937 and World War II. Owing

to the almost complete destruction of many cities during the war, the need for organic and radical town planning arose. New materials, such as cement, metal, and glass, and new techniques were employed. Numerous large public buildings were constructed, generally inspired by American architecture. Outstanding examples of the use of traditional forms and Western techniques are the exhibition building for the Kobe Trade Fair (1950) and the Hiroshima Memorial Peace Center (begun 1951; X, PL. 428), both designed by Kenzō Tange. The Japanese style, since the end of World War II, has been adopted only for a limited number of small private houses, and an increasing number of private dwellings, in wood or reinforced concrete, are being built in the Western style.

Sculpture. In 1927 the Kōzōsha, a new art group made up solely of sculptors, was founded, and in 1928 the Kokuga-kai was established with a sculpture department. The influence of the French sculptors Emile-Antoine Bourdelle and Aristide Maillol made itself felt in Japan about this time. There has been an increase in the use of sculpture in monuments and as architectural decoration, but ornamental sculpture, displayed mainly at exhibitions, still occupies the better part of the field.

Painting. Most of the Taisho artists survived into the Showa period and attempted to modernize the "new" Japanese painting of the Taisho period. The Sino-Japanese conflict of 1937 and World War II paralyzed practically every activity of Japanese artists; after Japan's surrender in 1945, however, the painters resumed their work. French and American influence is strong. Many artists imitate the Western style even in their Japanese paintings or use Western materials and paint brushes. The works thus created are hard to distinguish at a glance from Western paintings; these extremists ignore even the traditional Japanese emphasis on line and color. The present confusion prevailing in Japan, however, may be looked on as a state of transition in which artists are experimenting to produce an absolutely new school of Japanese painting.

Besides those painters already mentioned, the following masters are still active: of the Kanten group, Yamaguchi Hōshun (b. 1895) and Itō Shinsui (b. 1898), both of Tokyo, and Dōmoto Inshō (b. 1891), Fukuda Heihachirō, Tokuoka Shinsen, and Nakamura Gakuryō (b. 1890), all of Kyoto; of the Nippon Geijutsuin group, Okumura Dogyū (b. 1889).

Western painting had flourished in the Taisho period as vigorously as Japanese painting. In 1926 a department of Western painting was established in the Kokuga Sōsaku Kyōkai; in 1928 this department organized a separate group called the Kokuga-kai. Among its members were Umehara Ryūzaburō, Onchi Kōshirō (1891–1955), and Aoyama Yoshio (b. 1894). In 1931 Satomi Katsuzō (b. 1895), who had studied in France under Maurice de Vlaminck, and Saehi Yūzō (1898–1928) broke away from the Nika-kai and founded the Dokuritsu Bijutsu Kyōkai. The Issui-kai was established in 1936 by Yasui Sōtarō (1888–1955) and others, and the Shin Seisaku-ha Kyōkai was founded the same year by Ogisu Takanori (b. 1901) and Inokuma Gen-ichirō (b. 1902). A year later Hasegawa Saburō formed the Jiyū Bijutsu Kyōkai.

The increase in the number of private groups weakened the influence of the Kanten group, which continues to practice academic realism. The various European movements that the private circles follow are surrealism (Nika-kai), neoimpressionism (Shunyō-kai and Kokuga-kai), Fauvism (Dokuritsu Bijutsu Kyōkai), sensitive modernism (Shin Seisaku-ha Kyōkai), and nonobjectivism (Jiyū Bijutsu Kyōkai). After World War II other organizations were formed, whose members painted in the Western style: the Kōdō Bijutsu Kyōkai in 1945 and the Dainiki-kai in 1947, both founded by former Nika-kai members. Although at present all these independent groups are intent on copying Western styles, the creation of a unique Japanese style of oil painting must be their ultimate aim.

Since 1951, when several Japanese painters exhibited at the biennial in Saõ Paulo, Brazil, Japanese works of art have appeared in many international exhibitions in Europe and America. Many of the artists reside in Europe and appear to be open to the most modern tendencies.

Minor arts. During the Meiji-Taisho period, Japanese crafts had achieved a marked development, stimulated by demands from the nobles and rich merchants in Japan and from art lovers abroad. The craftsmen gradually were accorded the same social position as painters and sculptors. In 1927 several master craftsmen were chosen as members of the government-organized Teikoku Bijutsuin. The Secessionist and Art Nouveau movements, which had been introduced to Japan in the Taisho period, stimulated the development of new crafts, and the handicraft production advocated by John Ruskin and William Morris in England inspired the development of *mingei* or folk arts. In adapting Western styles, however, Japanese artists copied the external form and did not comprehend the spirit.

JEFFERSON, THOMAS. Author of the Declaration of Independence and third President of the United States, statesman, philosopher, and architect (b. Virginia, Apr. 13, 1743; d. Virginia, July 4, 1826). Jefferson was graduated from the College of William and Mary in 1762. When in 1769 he began serious proposals to build at Monticello, his knowledge of architecture must have been derived almost entirely from reading and from conversations. The development of Monticello from a simple Virginia country house to a structure with articulate massing of central and end pavilions joined by arcaded passages shows Jefferson's increasing grasp and assimilation of Palladian principles and reveals his individuality as an architect imbued with the ideal of classical monumentality. By the time he departed for Europe in 1784, Monticello was completed in its first form.

Finding the civil architecture of Virginia inadequate, he planned the remodeling of the Governor's Palace at Williamsburg and designed a statehouse for the new capital at Richmond. His wide European travel from 1784–89 sharpened his interest in classical architecture. "I am immersed in antiquities from morning to night," he wrote; and he found in the Maison Carrée at Nîmes the model which he adopted for his statehouse, the first public building to utilize the temple form and the first work of the classical revival in America (I, PL. 78). As Secretary of State, Jefferson made sketches and offered suggestions to Pierre Charles L'Enfant for the plan of the city of Washington which show his vital interest in city planning and his conviction that classical formalism provided the only worthy setting for the capital of the new republic. He made two designs for the President's house, one of which, a variation of Palladio's Villa Rotonda, he actually submitted anonymously in competition. At the same time he was also deeply involved in the selection and evolution of the Capitol design.

In 1794 he resigned from the Cabinet and returned to Monticello to continue (largely between 1796 and 1809) the remodeling he had been contemplating for some years. He also designed Edgehill (1798–1800) for his son-in-law, Thomas Mann Randolph, and Farmington (finished in 1803) for George Divers. As President he appointed Benjamin Henry Latrobe (q.v.) surveyor of the public buildings and assisted in the many changes in William Thornton's Capitol scheme. The design of the central mass of the building with its freestanding colonnade (I, PL. 79), embodied in Latrobe's drawings of 1807, seems to have been Jefferson's idea.

Poplar Forest, its plan based on a regular octagon, related to that of Monticello, was started on his farm of Pantops in 1806 and finally completed about 1822. In 1815 he designed Ampthill in Cumberland County for Randolph Harrison and, in 1817, Barboursville in Orange County for James Barbour. Bremo, planned during the same period for John H. Corley, with its ingenious use of different levels and of a semicircular ha-ha to unite outlying pavilions to the main block, its sober classical detail, and its bold simplicity of design, is one of Jefferson's most successful buildings.

The University of Virginia, planned as "an academical village" and virtually completed by 1824, crowned Jefferson's career. The design provided a rising perspective between facing colonnaded pavilions (each exemplifying the proper use of one of the classical orders) toward the dominating form of the library, a rotunda inspired by the Pantheon (I, PL. 80).

Inspired by the idea that only forms expressing the ideals of Roman republicanism were proper for new building in America, and powerfully influenced by Palladianism as an antidote to the Georgian baroque he deplored and by his admiration for contemporary French planning, Jefferson was a pioneer of the classical revival. His own work during this vital, formative period in America and his influence upon the work of others decisively directed the course of American classicism.

JEWISH ART. The exceptional historical vicissitudes of the Jewish people have affected their art possibly more than any other manifestation of their national life. On the one hand, the origins of the Hebrew nation are closely bound up with a religious covenant that involved a repudiation of the beliefs and rituals of the neighboring nations, including the expression of such elements in painting and sculpture. On the other hand, the dispersion of the Jews among other nations and their continuous wanderings for over two millenniums have rendered them highly receptive to the artistic influences of their host cultures. Consequently Jewish art acquired a great richness and variety; occasionally, however, this very fact makes the definition of the specific Jewish element a matter of considerable difficulty. Moreover, at least until the 19th century, the Jewish artist labored under the specific restrictions

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

of a nomocracy. These restrictions varied in severity but required even in the most liberal times a compromise between the prescriptions of a God-given law and the natural freedom of artistic expression. The existence of such restrictions in matters of sacral art — and until fairly recent times almost all art was sacral among the Jews — was not an unmixed disadvantage. It often rendered Jewish art more subtle and more adept in expressing esoteric meanings by the use of symbols. The customary disapproval of a considerable part — if not the majority — of the rabbinic leaders brought the Jewish artist closer to the simple people. His art may have lost something in formal perfection, but it gained in spontaneity and freshness of expression.

SUMMARY. Art and law (col. 899). Ancient Israel (col. 901). Hellenistic and early Roman periods: the Diaspora (col. 903). The later Roman period (col. 908). The Middle Ages (col. 911): *Byzantium; Islamic countries; The European West*. The modern era (col. 920).

ART AND LAW. Any discussion of the art of the Hebrew nation, any evaluation of its standing in universal art must start from the laws, both Biblical and rabbinical, that governed representational art. The origins of the Hebrew tribes and the historical circumstances which forged them into a nation are still obscure; however, there can be no doubt of the fundamental character of the henotheistic revolution that accompanied the birth of Israel. Nor can there be any doubt that it involved a violent denial of the religions of the ancient Orient in all their aspects. The worship of the forces of nature in their multiplicity found expression in the polytheistic variety of representations of the divine, which ranged from the anthropomorphic image to the floral and faunal, and included even the sacred stone, or baetyl. All these representations had in common the element of the immanent or the symbolic. This religious environment explains the violence and the sweeping character of the Second Commandment: "Thou shalt not make unto thee any graven image, or any likeness of any thing that is in heaven above, or that is in the earth beneath, or that is in the water under the earth: Thou shalt not bow down thyself to them, nor serve them" (Exod. 20:4–5). This is amplified in Deuteronomy 4:16–18, and in Deuteronomy 27:15 the man who makes any graven or molten image is solemnly cursed. Two points should be noted in connection with these passages: first, they seem directed in particular against the conception of the Babylonian pantheon, with its cosmos graded into a heaven above, an earth below, and a watery abyss beneath the earth; second, the prohibition specifically envisages a "graven" or "molten" (cast) image. Later interpreters were quick to exploit these verbal limitations, thus rendering lawful two-dimensional representations that could not reasonably be described as "graven." By stressing rather the additional prohibition of bowing to such images or of serving them, the original injunction could be further limited to representations actually serving, or likely to serve, idolatrous purposes. (See ICONOGRAPHY AND ICONOLOGY.)

Other passages indicate that the prohibitions were construed with much latitude even in Biblical times. Exodus 25–27 contains detailed descriptions of the tabernacle with its cherubim in the holy of holies and its candlestick with knops and flowers. Numbers 21:9 gives an account of the making of a brazen serpent by Moses, an image which was apparently kept in a high place until it was destroyed by the zealous king Hezekiah (Num. 18:4). The Bible also gives details of the Temple of Solomon (I Kings 7) and of Solomon's throne, with lions standing on its steps (I Kings 10:18–20). These examples indicate too that the works of art referred to received the approval of the author or the editor of the canonical Bible. The popular practice can be surmised from stories such as that of Micah (Judg. 17) and from the archaeological finds mentioned below.

In the post-Biblical periods of antiquity and the Middle Ages, the same ambivalent attitude is exhibited. Whenever there seemed to be some danger of idolatry involved in making works of art, opposition became violent. The violence often increased in proportion to the political or social dangers threatening the moral or economic existence of the Jewish nation. Whenever there was a lessening of the external danger, the popular attitude changed and great latitude was allowed in practice. Even the rabbinic authorities of such laxer times had to adapt themselves, to some extent, to the popular trend. In the Persian period (536–332 B.C.), for example, since the danger of idolatry was insignificant, the high priestly authorities of the province of Yehud (Judea) did not hesitate to strike coins in their own name, imitating the Athenian tetradrachma with its owl and human faces in relief. With the advent of Hellenism, this tolerant attitude gained still more ground among the Hellenized aristocracy, as is evidenced by the lion frieze in the castle of the Tobiads in 'Arāq el-Emīr, east of the Jordan. It was possibly at this time that Hellenized Jewish circles in Alexandria evolved a narrative cycle of Biblical scenes intended to illustrate the Greek translation of the Old Testament in the manner in which Homer and the other Greek classics were illustrated. Somewhat later, however, the clash of the Greek and Jewish cultures and religions that resulted in the Hasmonean revolt caused a complete reversal of this attitude. Hasmonean coinage was aniconic (PL. 333). Most of the Jewish tombs of the Hellenistic and Roman periods are ornamented with geometric and floral motifs exclusively. When Herod the Great struck coins with such pagan symbols as the caduceus of Hermes and the tripod of Apollo, these were introduced as if by stealth, and when he dared to place a golden eagle on the façade of the Temple, two young Zealots, instigated by their rabbinical preceptor, removed it in broad daylight (Josephus, *Antiquities*, XVII, 151; *War*, I, 650). The statues in the palace of Herod Antipas in Tiberias were smashed by order of the Sanhedrin (Josephus, *Vita*, 65). Roman troops passing through Judea were even ordered to remove images from their standards.

There are evidences of a change in the Jewish attitude toward art in the 1st century of the Christian Era. Herod Agrippa I, although he minted coins bearing his own image as well as that of the emperor, remained one of the most popular of the Jewish kings. According to one Talmudic source, all kinds of images were to be found in Jerusalem toward the end of the period of the Second Temple. After the destruction of the Temple, the Jewish leaders, particularly the patriarchal house of Hillel, continued this tolerant attitude. They used seals with images and entered freely into buildings such as public baths decorated with the statues of gods, reasoning that since the purpose of the bath was not idolatrous the statues used to decorate it should not be regarded as idols (Mishnah, *Avodah Zarah* III, 4). As the danger of relapse into paganism became more remote, in the 3d and 4th centuries, the rabbinical rulings became even less severe. The Jewish leaders in Babylonia had always been less strict, for there the Jews lived under the rule of the Parthian kings, who, like their Persian predecessors, were Zoroastrian dualists. In the late Roman Empire, since Christianity, the great rival of Judaism, did not practice image worship, rabbinical precautions could be relaxed without danger. Rabbi Johanan (3d cent.) smashed the idols in the public bath of Tiberias, but allowed two-dimensional art on the walls (Jerusalem Talmud, *Avodah Zarah*, 42d). In the 4th century, mosaic pavements were allowed by Rabbi Abun. From the extant synagogue decorations of the 3d and 4th centuries it is apparent that sculptured reliefs (and occasionally sculpture in the round) were freely used in Palestine. The synagogue frescoes of Dura-Europos, a Mesopotamian city located on the upper Euphrates, near the Parthian border, show the freedom allowed to artists in the Diaspora (PL. 335). In the 6th century, mosaic pavements of synagogues show scenes from the Bible, including even a symbolic hand of God, and images of such pagan deities as Helios and Selene. The reaction that set in during the 7th century must have been due in large part to the influence of Islam, in which the traditional desert-nourished aversion to figural art again found forceful expression.

Jewish art in the Middle Ages was influenced by Islamic aniconism on the one hand and by the artistic freedom of Christian Europe on the other. The resultant split can best be observed in book illumination: In the East, Hebrew books

UP State Museum, Lucknow

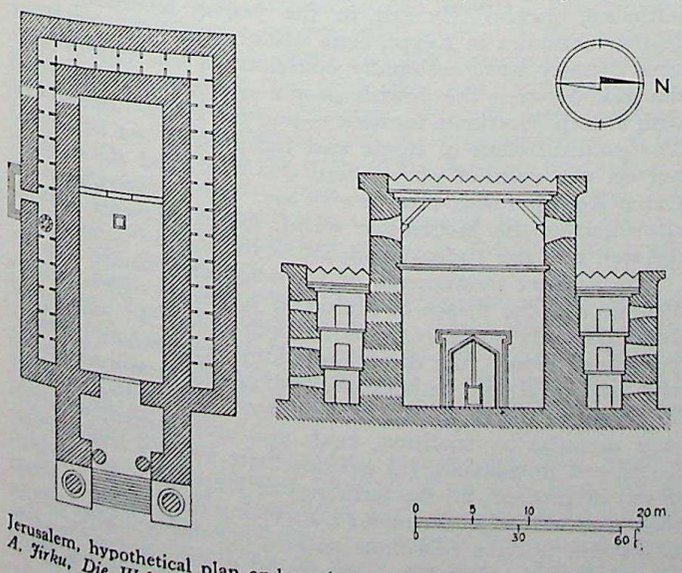
CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

are found which are devoid of all ornament except the arabesque, while in the West there is a spate of illuminated manuscripts in which Biblical scenes are represented figurally in the rich landscape and architectural setting of Gothic art. (Here too there are occasional evidences of restriction, however. One of the strangest appears in a manuscript haggadah which depicts the Jews and angels with the beaks of birds, but does not deny human likeness to the Gentiles. It is the divergence between East and West, together with the subtle way in which they occasionally converge, that lends its peculiar fascination to the Jewish art of this period.

ANCIENT ISRAEL (ca. 1200–300 B.C.). The nomadic way of life of the Hebrews during the period of the Patriarchs and during their wanderings in the desert has naturally precluded the survival of any tangible remains of their artistic activities, other than the literary evidence referred to above. The conquest of Canaan under Joshua was marked by destruction of the sacral arts of the Canaanites and by a general decline of material culture rather than by fresh artistic activity on the part of the invaders. Not until the period of the Monarchy (Iron Age I and II, ca. 1000–586 B.C.) are we able to judge the character and qualities of Israelite art on a factual basis.

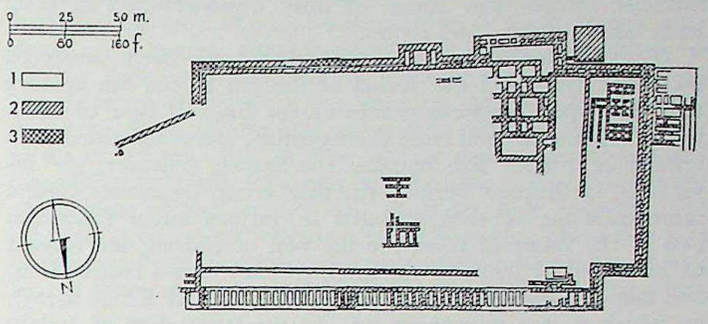
Situated on the narrow strip of fertile territory between the Mediterranean Sea and the Arabian Desert, and forming a connecting bridge between Egypt and Mesopotamia, ancient Israel was at the crossroads of four cultures (see SYRO-PALESTINIAN ART); the strongest influence in matters of art was exercised by the neighboring Phoenicians, with whom Israel maintained close cultural and political relations. It was through the medium of their eclectic art that the Hebrews found their way into the artistic traditions of the ancient Orient. It should be noted at the same time that the remains found so far, whether in the more cosmopolitan Israel or in traditionalistic Judah, show absolutely no aniconic tendencies. There are, to be sure, few traces of sculpture in the round, but there is no evidence whatever of reluctance to represent human and animal forms in the relief decoration of ivories and seals or in the hundreds of pottery figurines, vessels, and plaques. Most of the finds — which could be related to all classes of society, from the royal court and the aristocratic houses to the dwellings of the poor — display a pronounced pagan character, showing only too well how justified were the prophetic strictures against the backslidings of Israel, its ritual art included, into pagan worship.

An assessment of the artistic influences that dominate Hebrew art in the period of the Monarchy may well begin with architecture. The description of the Temple of Solomon in the Bible recalls in plan and detail the Syrian temple excavated at Tell Ta'inat and ascribed to the 8th century B.C. There is the same tripartite arrangement: an anteroom with two columns is followed by a cult hall and a cella, the holy of holies



Jerusalem, hypothetical plan and section of the Temple of Solomon (*from A. Jirku, Die Welt der Bibel, Stuttgart, 1957, pl. 82*).

(FIG. 901). Similarly, northern (Hittite?) influences can perhaps be traced in the fortified acropolis of Samaria, with its casemate wall (FIG. 902). The palace structures of kings Omri and Ahab were built on the plan of an open space enclosed by rooms. Each unit was integrated into the general scheme of the palace, with its central court and halls of ceremony. The origin of this plan is obviously the North Syrian palace, which for some time dominated the palace architecture of the ancient



Samaria, fortified acropolis with plan of the palace complex of the Kings of Israel. (1) Standing walls; (2) remains; (3) unexcavated areas.

East, including Assyria. More original are the dwelling houses found in the Israelite levels of such excavated sites as Megiddo and Lachish, consisting of an open court flanked by two elongated rooms, with a third room set crosswise behind the court.

Phoenician influence on Israelite architecture is strongly apparent in the typical treatment of ashlar in Samaria: each stone is drafted on its outer face with a margin on three sides. Precisely the same kind of stone dressing has been observed in the constructed parts of contemporaneous Phoenician tombs found at Achzib.

The architectural ornament of the Israelite period consists mainly of volute capitals, usually termed "proto-Aeolic," having a triangular leaf in the center and two curling leaves (shaped like spirals) on the sides. Though ultimately derived from the lotus capital of Egypt, the Israelite capitals were copied not directly from the Egyptian models but from Cypro-Phoenician imitations; they are consequently much more formalized. Capitals of this kind, some of them of considerable size, have been found at Megiddo (I, PL. 526), Samaria, and Ramat Rahel, south of Jerusalem. At the last-named site there was found also a frieze decorated with lotus flowers shaped like fleurs-de-lis. Capitals with double volutes are represented on pottery models of shrines discovered in Sharuhen (Tell el-Fara) and sites east of the Jordan.

Because it was transmitted by way of Phoenicia, the basic Egyptian influence on Israelite architecture is often camouflaged (see PHOENICIAN-PUNIC ART). However, it is plainly evident in some rock-cut tombs in the Valley of the Kidron, east of Jerusalem, which date from the time of the Judean Monarchy (PL. 331). The pyramidal shape of the roof and the molded cavetto and cornice are close imitations of features of Egyptian funerary shrines.

The extant metalwork is almost entirely utilitarian. There are some fine incense stands and tripod bases, the stands bearing openwork representations of priests making offerings or praying to images of seated deities, the tripods with a garland of leaves as their sole ornament. Much more numerous than the metal objects are pottery figurines and plaques, in particular those of Astarte; these represent nude women holding flowers, tambourines, or doves, or playing the flute. The number and the variety of types indicate that despite Biblical prohibitions the popular worship of Cannaanite gods continued in Israel. Other Israelite work in the round includes figurines of riders and chariots, miniature representations of tables, beds, and chairs, and models of shrines.

Among the finest works of art of the Israelite period are the ivory plaques found in Samaria (PL. 332), probably in the ruins of the "ivory house" (I Kings 22:39) of Ahab, king of Israel (875–850 B.C.); these are clearly of Phoenician origin. Comparable objects, probably Assyrian spoils of war, have

UP State Museum, Lucknow

been found at Nimrud and Arslan Tash (I, PL. 526). The ivories from Samaria show a mixture of styles characteristic of Phoenician art: Egyptian, Mesopotamian, and Hittite influences are evident, Egyptian predominating. Thus images of the Egyptian deities Ra, Horus, Isis, and Nephthys are found, along with a representation, clearly of Mesopotamian inspiration, of a lion attacking a bull. The plaques, some of which were made of black (smoked) ivory, were carved in low relief on thin pieces of the material; others had traces of inlay ornamentation in gold, lapis lazuli, stones, and so on.

The numerous Israelite seals that have been preserved (PL. 332) date from the period of the 8th to the 6th century B.C. They fall into three groups on the basis of type of decoration. Some, derived from the Egyptian, are ornamented with griffins or shaped like scarabs; the names, however, are invariably in Hebrew script. Another group comprises figural representations of men engaged in various ritual functions; two of the finest of these are the seal of Shema, the servant of Jeroboam II (ca. 785–745 B.C.), which shows a roaring lion, and that of Jaazaniah, "servant of the king" (cf. II Kings 25:23), on which a cock is represented. In the latter days of Judah, especially after the reforms of Hezekiah and Josiah, even such modest representations were apparently frowned upon; in consequence, the latest seals — the third group — revert to the purely aniconic type of decoration, the artistic effect being achieved by the use of a finely spaced alphabetical script. The jar-handle stamps marked with a "flying scarab" and the words *lammelekh* ("belonging to the king"), followed by a place name, belong to this group.

Thus Israelite art, which at first gave evidence of reluctance to adopt the rich imagery of the nations surrounding Israel and subsequently for a time borrowed freely from its neighbors, reverted finally to its original strictness. Only by returning to its basic traditions could the Hebrew nation hope to preserve its identity during the long Babylonian exile.

HELLENISTIC AND EARLY ROMAN PERIODS: THE DIASPORA (333 B.C.–A.D. 70). Greek influences had begun to penetrate into the East soon after the victory of the Greeks over the Persians in the middle of the 5th century B.C. In the Persian period, however, such influences remained restricted to the coastal area, leaving Judea almost untouched. The only evidence of Attic influence there are the coins bearing the image of the owl of Athena and the heads of deities struck by the Jewish autonomous authorities.

Alexander the Great conquered Judea along with the rest of the Persian empire. During the period of his successors, the Ptolemies (312–198 B.C.) and the Seleucids (198–141 B.C.), Hellenic influences broadened and deepened, affecting all spheres of Oriental life. The ultimate result was the creation of a cosmopolitan Hellenistic culture.

In Judea, the scope of Hellenistic influence was restricted by the essentially aniconic — or rather anti-iconic — character of the Jewish religion. Thus it was only in secular life that Hellenism was to find scope for expression. When the Hellenizing Jewish circles attempted to carry the dominant Greek culture into the realm of religion, they provoked the Maccabean revolt. After the victory, however, and after the reestablishment of an independent Jewish state (141–63 B.C.), the need to integrate this state into the framework of contemporary civilization resulted in a cultural compromise whose effects were apparent in the domain of art. A Jewish art developed which, while keeping aloof from images, took over some elements of Greek architecture and ornament on a highly selective basis; on the whole it favored contemporaneous Oriental elements and techniques.

Among the architectural remains of the Hellenistic period, first note should be taken of the Tobiad castle at 'Arāq el-Emīr, which dates from the early 2d century B.C. Its architectural ornament is a blend of Hellenistic and Oriental motifs. The façade displays an entranceway combining a Doric lintel frieze with Corinthian columns; a clerestory above this is flanked by a frieze of lions, facing toward the center, in high relief — a feature that reflects Babylonian and Persian prototypes.

The development of the plans of Hasmonean buildings can be followed by comparing the typical Oriental constructions at Beth-zur and Gezer with the commander's residence at Tell el-Judeida, probably late Maccabean, which is divided into two parts, one a Hellenistic house, peristyle, with Doric columns, and the other a gynaeceum of Oriental type with a narrow protected entrance and a congeries of small rooms round a second courtyard. This plan reflects the dual aspect of Hebrew culture of the period.

The greater freedom allowed the arts in the early Maccabean period is evidenced by the family tomb constructed by Simon (ca. 142–135 B.C.) at Modin; it had marble pyramids and sculpture in the round representing ships and trophies. Of the tombs found in Jerusalem and its vicinity two have been assigned to the Maccabean period: the tomb of the priestly family of the Beni Hezir, the so-called "Tomb of St. James," in the Valley of the Kidron (PL. 331), and the tomb discovered in 1956 in Alfasi Street in the Rehavia section of Jerusalem. Both have in front of the tomb cave proper a pillared façade which is combined with a pyramidal monument (*nefesh*). The façades and the loculi inside the burial caves are clearly derived from Hellenistic prototypes. In the Alfasi Street tomb the pyramid surmounted an entrance divided into two by a single pillar; the stuccoed walls of the antechamber were decorated with crude drawings representing a naval battle. The Beni Hezir tomb has a rock-cut Doric façade with two columns in the center and two flanking pillars.

The Hasmonean reaction against Hellenistic civilization is also evidenced by coins; yet here too a characteristic compromise with the world around Judea can be noted. The earliest Hasmonean coins, now generally attributed to John Hyrcanus I (135–104 B.C.), adapted the cornucopias found on the reverse of Seleucid coins by replacing the accompanying caduceus with the pomegranate, a fertility symbol not overtly connected with any pagan god. The image of the king on the obverse is replaced by an inscription enclosed in a wreath — an equating of the written word with the image that is characteristically Jewish. Alexander Jannaeus (103–76 B.C.) assumed the title of king and struck coins with bilingual (Greek and Hebrew) legends. He used such symbols of good fortune as stars, wheels, and flowers, but he did not dare to coin in his own image. The symbols of Hasmonean numismatics thus generally remained neutral; only on coins of the last king of the dynasty, Antigonos Mattathias (40–37 B.C.) — which bore the table of the shewbread and the seven-branched candlestick, or Menorah (PL. 333) — do sacred Jewish symbols appear.

The Herodian period in Judea begins with the conquest by Pompey in 63 B.C.; the destruction of Jerusalem, A.D. 70, can be taken as the *terminus ad quem* for the ancient Jewish monuments of that city and its environs. This period is characterized by great economic prosperity and by the growth of influence, increasingly felt in the Jewish homeland, of the Jewish Diaspora in Egypt, Asia Minor, and Italy. The Herodian dynasty was profoundly conscious of the need to bridge the gulf between the Jewish people — seething at that period with a deep Messianic ferment — and the Greco-Roman world. The political clash of Rome and Judea could not be avoided, but on the cultural plane there was a gradual absorption of Greco-Roman forms into Jewish art. By a process paralleled elsewhere in the Hellenistic world, Greek elements were integrated into the Judeo-Greek art of the Roman period.

The greatest monuments of Herodian architecture were the Temple and the Palace of Herod in Jerusalem. Unfortunately there are only scant remains in both cases. In judging the Temple of Herod, the three limitations under which his architects labored should be kept in mind: (1) the measurements and the layout of the buildings, as well as of their component parts, were dictated by tradition, both oral and written, and were considered immutable; (2) besides their avowed aim, whether sacred or profane, all the buildings of Herod had another purpose: they served as fortresses buttressing the king's imposition of his will upon a rebellious nation; (3) the buildings had to be strictly aniconic while conforming to the current taste in ornament, in particular to that of the multitude of pilgrims

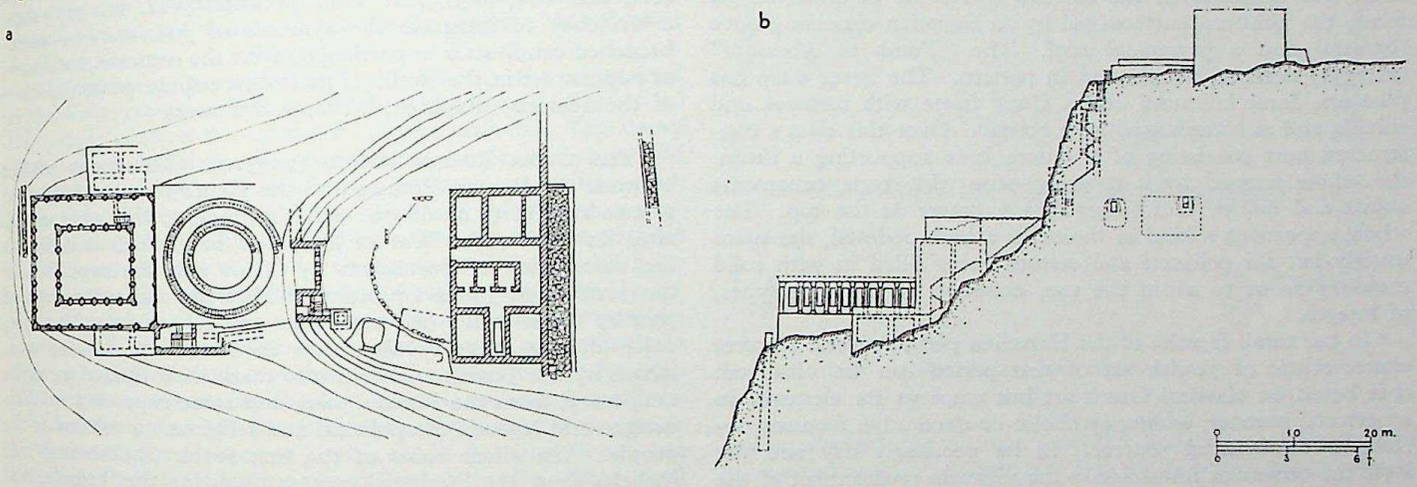
905

from the Diaspora who were familiar with the prevailing styles of Greco-Roman architecture. Despite these limitations, the saying was that he who had never seen Herod's Temple had never seen a fine building in his life. According to Josephus, the whole structure, of marble and gold, appeared at a distance like a mountain covered with snow glittering in the sun.

In order to create an appropriate setting for the Temple, Herod had constructed a vast rectangular esplanade (about 600 × 1,000 ft.). The Temple mount was entirely surrounded by a retaining and curtain wall of monumental masonry — smooth up to a certain height, and above this point molded in projecting flat pillars. This type of revetment can be studied in the wall encircling Abraham's tomb at Hebron, which also dates from the time of Herod. The general effect recalls Oriental temenos walls; the treatment is ultimately derived from the ornamentation of the brick walls of early Mesopotamian sanctuaries. Inside the wall the esplanade was surrounded with porticoes in the Hellenistic style. Of special interest was the southern portico, the "royal stoa," which was a basilican building (one of the earliest of this type), with a heightened nave topmost part of the palace was a small dwelling house (about 70 × 40 ft.), facing a semicircular terrace. It consisted of three small rooms, protected by a Π-shaped corridor extending around them, and two wings of three rooms each. Some of the rooms were paved in black and white mosaics in the geometric patterns common in Italy at the time of Augustus. From this house a staircase led down to the middle terrace, occupied by a circular structure of unknown purpose, comprising two concentric walls, about 50 ft. in diameter. Another staircase led to the lower terrace, most of which was taken up by a square structure, about 55 ft. across, comprising an open court surrounded on all four sides by an ambulatory. Each of the two walls of the ambulatory — the interior one, forming the boundary between it and the court, and the exterior one, constituting the perimeter of the structure — had an inner and an outer order of engaged Corinthian columns separated by windows. The inner order of columns of the interior wall stood on high pedestals; the other three orders of columns were full-length. The inner face of the exterior wall of the south wing of the ambulatory, as well as the inner and outer faces of the entire interior wall, were



Masada, Herod's palace. (a) Plan; (b) east flank showing sections of structures on several levels (*from M. Avi-Yonah et al., Masada: Survey and Excavations, 1955–1956, Jerusalem, 1957*).

and two aisles; it had clerestory lighting. The inner sanctuary consisted of a rectangle divided into two parts: a women's court to the east preceded the sanctuary court proper; inside the latter court stood the altar of sacrifices, before the sanctuary itself. The entire structure conformed to Greco-Roman style in its accessories but preserved the ritual traditions. Thus the gate of the women's court and the Gate of Nicanor, both donated by Jews of the Diaspora, were presumably adorned in the Hellenistic style favored by the donors. The Nicanor gate was preceded by a portico; this as well as the porticoes surrounding the women's court and the inner court probably had Corinthian columns, the order that was certainly used in the four huge columns that decorated the façade of the sanctuary proper, as can be determined from the representations of the façade of the Temple on the coins of Bar Kokhba (PL. 332) and in the synagogue frescoes from Dura-Europos (PL. 333). On the other hand, the characteristic overhang of the lintel over the central gate of the Temple was copied in the doors of tombs and of later synagogues.

The objects in the Temple seem to have preserved the style transmitted from the Persian period. Only the base of the candelabrum (at least as represented on the Arch of Titus in Rome; IX, PL. 161) bears the imprint of the Hellenistic style of the Herodian period: it shows images of dolphins, hippocampi, and so forth.

Important remains of Herodian architecture have come to light in the remote fortress of Masada on the shores of the Dead Sea (FIG. 905). Masada is built on an isolated flat rock about 1,000 ft. above sea level. The principal building there was Herod's palace, built on three terraces overhanging the abyss below the northern point of the fortress plateau. The covered with multicolored semigeometric paintings. The column shafts, built of masonry, were stuccoed over to give the effect of fluting. The palace at Masada, constructed at so great a cost in labor and means, illustrates not only the daring engineering enterprise of Herodian architecture but also the overbearing and inhuman character of the king. The whole complex was planned to function as a unit for Herod and a small entourage.

The other buildings at Masada included vast storehouses and barracks, built on the usual Hellenistic plan as exemplified at Pergamon, and another palace, probably intended for the royal suite. The principal parts of this palace were two groups of rooms, centered on an open court; one group seems to have had a *prostas*. The walls were stuccoed and molded, and traces of paint were observed on them. The whole fortress was provided with a casemate wall and a system of immense rock-cut cisterns fed by an aqueduct.

Herodian tomb architecture is exemplified by scores of tombs in the Kidron and Hinnom valleys. Among these are a number of large tombs; these include the so-called "Tomb of Zechariah" (second half of 1st cent. B.C.), "Tomb of Absalom," and "Tomb of Jehoshaphat," as well as the tomb of Herod's family, the tombs of the kings of Adiabene ("Tombs of the Kings"), and the tombs of the Sanhedrin ("Tombs of the Judges"). These rock-cut tombs are principally of symmetrical plan based on an axis that passes through a central hall and the main burial chamber; the hall is flanked by other halls, each with its loculi fanning out into the rock. The characteristic sepulcher of the period had an entrance cut in a perpendicular rock face and was preceded by a courtyard, often provided with benches. If the entrance was wide enough, it was subdivided by columns or pillars. The antechamber behind the

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

portico led to the main burial hall; the entrance to the latter was occasionally protected by a removable stone.

Above the façade of the more ornate tombs is a gable or lintel, cut in low relief and surmounted by an acroterium formed of acanthus cups or wreaths. The surface of the gable is covered with a low-cut, dense scroll of acanthus leaves evolving from a central group of leaves; grapes, pomegranates, and citrus fruits are occasionally added. The carving of the leaves is sharp and dry. The lintel over the tomb entrance is usually of the Doric type, its frieze having triglyphs and metopes, the latter filled either with a classical round shield or wreaths or rosettes. The frieze itself is used without much appreciation of its architectural value, often being interrupted by symbolic representations of vessels, wreaths, and fruits (in particular the vine, with leaves, tendrils, and bunches of grapes). Occasionally a band of vegetation is added to the lintel.

The same disregard of the classical orders is evident in the monuments sometimes placed before tomb entrances in this period. The best-preserved of these are the "Tomb of Zechariah" and "Tomb of Absalom." The former is a rock-cut cube with pilasters in the corners and Ionic columns on its faces, the columns surmounted by an Egyptian concave groove (cavetto) and a pyramidal roof. The "Tomb of Absalom" (PL. 331) is more complicated in pattern. The lower cube has pilasters, Ionic columns, and a Doric frieze with metopes and shields, and is surmounted by a cavetto. Over this rises a constructed part consisting of a square base supporting a drum, the whole capped by a tapering cone with rope ornaments above and below, and (originally) a flower at the top. The whole appears as a kind of tholos on a high pedestal, the space usually left for columns and statues being filled in with solid masonry so as to avoid the use, common in the prototypes, of images.

In the tomb façades of the Herodian period several features characteristic of Jewish art of that period can be observed: it is based on classical Greek art but employs its elements in an eclectic manner, adding symbolic or decorative features derived from Oriental sources. In its peculiarly dry and flat style the ornament foreshadows the ultimate replacement of the glyptic principle of classical relief by the optic principle, based on the contrast of light and shade; it also prefigures the stylization of naturalistic details and the characteristic Oriental *horror vacui*. The use of specific Jewish symbols, such as the Menorah, is avoided.

The ossuaries which are a characteristic feature of Jewish burials in Jerusalem in the last century before and the first century of our era are important because they occur in quantity and because they represent a popular art. These stone boxes, intended to hold the bones of the dead after the decay of the flesh, are for the most part about 20–30 in. long, 8–12 in. wide, and 12–15 in. high (PL. 332; V, PL. 338). The lids vary in shape, being flat, arched, or gabled. The basic pattern of ossuary ornament consists of two six-petaled rosettes within a framework of straight and wavy lines; in many cases this is interrupted by the addition of other elements — for example, representations of buildings, columns, doors, objects such as cups, vessels, and weapons, and a variety of plants and plant ornaments (these last occasionally stylized or shown in section). The rosettes and the rest of the ornament are executed in the chip-carving technique, probably derived from working in wood. The incised portions are deeply gauged, with sharp arrises, thus giving the same effect of sharply contrasted light and shade as is seen on the tomb façades. Undoubtedly this type of ornament reflects a type of local craftsmanship based on Oriental (in this case Israelite) traditions of the pre-Hellenistic period. The ossuaries are thus very early representatives of a specific artistic style that appears at a later date in Coptic art and in Byzantine ornament in general.

As opposed to the popular art of the ossuaries, the sarcophagi found in the "Tombs of the Kings" and in the tomb of Herod's family obviously represent the type of ornament acceptable to the aristocracy. This consists in the main of floral motifs, rosettes, and scrolls similar in style to the tomb pediments described above.

The artistic influence of the Jewish communities scattered abroad — and especially numerous in Egypt, Asia Minor, and Greece — first made itself felt in the Hellenistic period, increasing considerably in the times of the Augustan peace and under the Julio-Claudian dynasty. The isolated groups of Jews living among Gentiles were naturally more exposed to the dominant Greco-Roman culture. In the domain of thought they reacted by developing the Neoplatonic philosophy of Philo; in the domain of art they reacted by adjusting their needs to the formal aspect of Hellenistic ornament, at the same time dissociating themselves from anything pronouncedly pagan. It was as part of their endeavor to propagate Judaism that the Hellenized Jews of Alexandria seem to have evolved their narrative cycle of Biblical scenes illustrating the Septuagint. No direct evidence of this illustrated Bible has been found, but its influence is evident in the early catacomb paintings and is still felt in the frescoes of the Synagogue of Dura-Europos (PL. 335) and the illuminated miniatures of Byzantine manuscripts. The extant Jewish paintings and reliefs in Roman catacombs such as those of Monteverde, Vigna Rondanini (III, PLS. 101, 103), and Villa Torlonia (VII, PL. 405) show a tendency to integrate the symbols of Judaism (the seven-branched candlestick in particular) with the common vocabulary of popular art in the Rome of their day: cupids, personifications of the seasons, dolphins, birds, and flowers.

THE LATER ROMAN PERIOD (70–324). The latent conflict between the Roman Empire and the Hebrew nation finally led to two revolts (A.D. 66–70 and A.D. 132–35, the latter called, after its leader, the War of Bar Kokhba), which ended with the destruction of Jerusalem by Titus and the expulsion of the Jews from Judea by order of Hadrian. In such times of conflict there could be very little artistic activity. However, twice during these revolts coins in silver and bronze were struck by the Jewish authorities to mark their liberation, albeit temporary, from the Roman yoke, and these expressed in their designs and legends the political and religious aspirations of the people. The silver coins of the first revolt (shekels and half shekels) show the sacrificial cup, symbolizing the Temple, and on the reverse, three pomegranates on a stalk, possibly the arms of Jerusalem. The symbols appearing on the bronze coins are the palm tree, a well-known mark of Judea, the citrus fruit (ethrog) used during the Feast of Tabernacles, and the symbolic vine leaf and amphora. The coins of Bar Kokhba are inferior in execution but somewhat superior in design (PL. 332). They repeat the amphora and vine leaf, the palm tree, and so forth, but these are represented with more feeling for decoration and better spacing. They also show the Temple façade and a series of musical instruments used in divine services (trumpets, harps, and lyres). This double series of coins gives us an indication of the craftsmanship and artistry of the Jewish engravers, who worked independently of — and even in opposition to — the tendencies current in contemporary numismatic art.

The suppression of the two revolts caused Palestinian Jewry to concentrate in Galilee, and it is there that the principal monuments of Jewish art from the 3d and later centuries must be sought. The *modus vivendi* that was achieved between the Roman government and Palestinian Jewry from the 2d century onward made possible the construction of a series of monumental stone synagogues in Galilee. These buildings, among them the Synagogue of Capernaum (PL. 334; FIGS. 909, 910), were erected with the façade looking toward Jerusalem; the wall facing toward the Holy City was made particularly ornate, with a triple entrance imitating Syrian temple façades. The central door was made higher and was surmounted by a large semicircular window, with a smaller window flanked by colonnettes and curved above in a shell-like arch.

In plan these synagogues were basilican, with a central nave surrounded by three aisles, two lateral and the other transverse. The roof was supported by columns placed on high pedestals. The columns were for the most part of the Corinthian order but with simplified detail; the leaves of the capitals in particular are sharply cut and present a pattern of light and shade that seems both to recall ossuary ornament and to anticipate By-

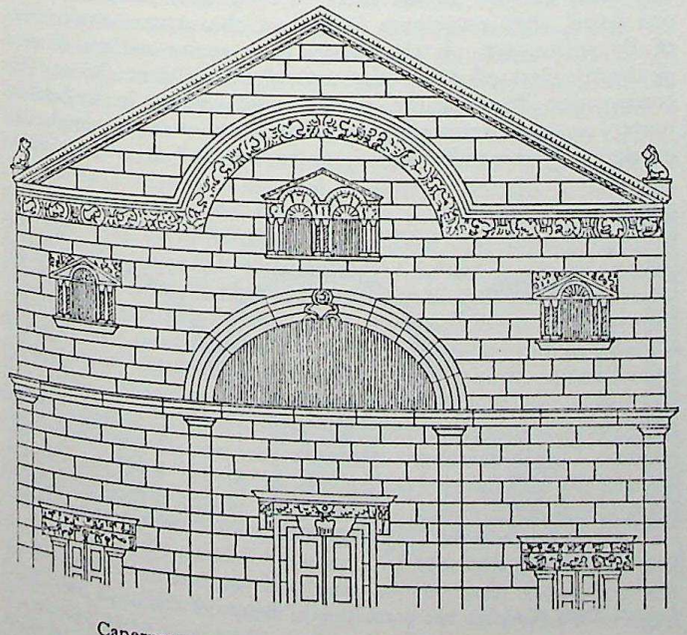
zantine capitals of the 5th and 6th centuries. The main hall of the synagogue had a gallery, probably for the women; the richest part of the architectural ornament was reserved for this feature of the building. The gallery was thus in contrast with the plain interior of the hall, which had bare walls with benches running round them. The door jambs, lintels, and especially the great frieze of the gallery were decorated in high relief. Besides geometric and floral motifs and representations of the palm tree, the vine, the pomegranate, and other characteristic fruits of the Holy Land, there occur magic symbols such as the type of hexagram later called the "Shield of David" and the type known as the pentacle ("Seal of Solomon"). The Jewish sacral symbols that appear are not numerous: they include the seven-branched candlestick and its accessories and the Ark of the Law (in one case the Ark of the Covenant shown on wheels, as it was supposed to have traveled in the desert). Architectural ornament also included representations in relief of eagles, hippocampi, griffins, and even angels in the form of winged Victories. In one synagogue (Chorazin) the frieze shows a figure of Hercules, a Gorgon's head, and vintage scenes with human figures. Other places have yielded fragmentary remains of sculpture in the round, in particular of lions that flanked the Torah shrine.

The relative artistic freedom apparent in the decoration of the early group of Galilean synagogues is an indication of the latitude allowed the architect and the sculptor. The decay of the old polytheistic religions, which was manifest in the 3d century, made the danger of idolatry seem much less acute in the eyes of the rabbinical authorities, and they therefore permitted a much freer use of figural ornament. It is quite possible that they were forced to this by the attitude of the Jewish laity, whose views had by that time drawn much nearer to Greco-Roman culture. This liberal position was only temporary, however, for at a later date the images of men and animals in these synagogues were smashed by Jewish iconoclasts, who refrained from damaging the inscriptions and floral symbols.

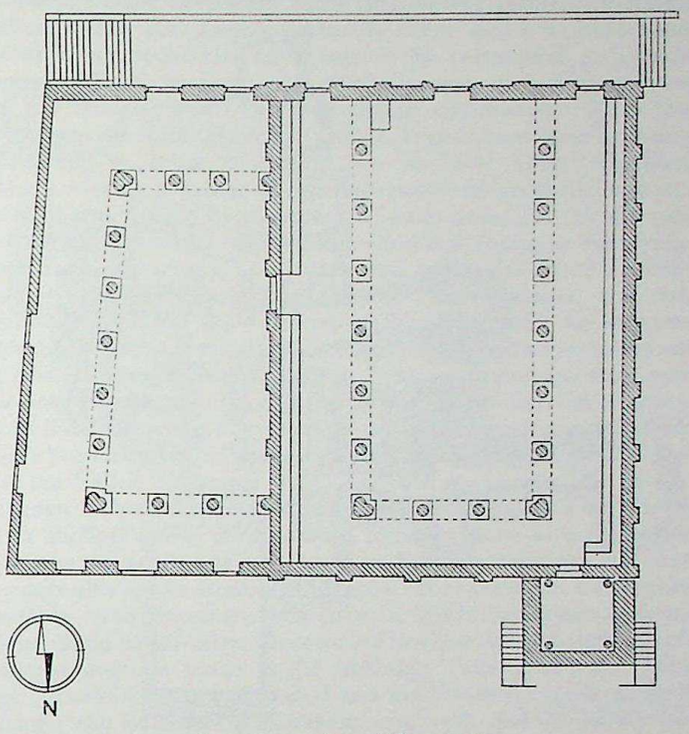
After the early Galilean synagogues, the second main source of our knowledge of ancient Jewish art in Palestine in the late Roman period is the necropolis of Beth Shearim. This small Galilean town was chosen by the patriarch Judah I (135–ca.



Capernaum, reconstruction of Synagogue façade.

212) as his burial place and thus became in the 3d century the central necropolis of world Jewry. The catacombs continued to be made until the year 351.

The tombs at Beth Shearim, which were cut in the hillsides below the town, are of three principal types: small catacombs consisting of a court with several burial halls branching off; large catacombs with several systems of halls and burial chambers, often connected by a corridor and arranged one above another (in this type of catacomb would be entombed the dead from a single vicinity, grouped in family vaults); and monumental burial caves surmounted by mausoleums. Burial



Capernaum, plan of Synagogue.

was usually in loculi or under arcosolia, and the tombs are marked by inscriptions, 80 per cent of which are in Greek, the remainder in Hebrew and Aramaic. The decoration of the usual catacomb consisted of designs painted or scratched on the surface of the wall or of low reliefs cut into the rock. The motifs include about twenty different variations of the Menorah, which had become by that time the central symbol of Judaism. Somewhat rarer are representations of the Ark of the Law, usually surmounted by a shrine, flanked by columns and approached by steps. This seems to have reproduced fairly accurately the contemporary architectural arrangement of the synagogue. The Jewish sacred symbols are accompanied by representations of lions, rosettes, ships, and a number of figures of human beings (one of whom supports a Menorah on his head; PL. 333). There were also secular figures such as cavalrymen, either mounted or leading their horses, and Roman soldiers and gladiators. The workmanship, usually very crude, exhibits the typical Oriental combination of conceptual composition and realistic detail.

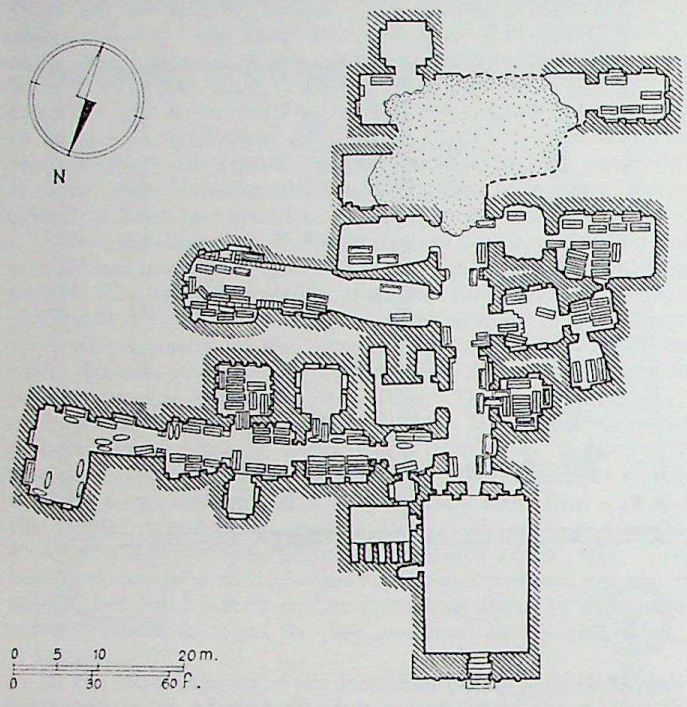
Outstanding among the catacombs at Beth Shearim is a group of burial caves of monumental character. One of these (No. 14) is supposed to have contained the burials of Judah I himself and of his three sons, and of numerous other rabbis. It has an ornamental façade of three arches, surmounted by steps leading to a niche, probably a place of prayer, facing toward Jerusalem. The interior is severely aniconic. Nearby is a similar triple-arched façade, leading to another large catacomb (No. 20; FIGS. 911, 912), which contained over a hundred sarcophagi, some of them decorated with figures. The decorations include a bearded human face, lions affronted over a bull's head or a vase, a lion attacking a gazelle, eagles, fish, and rosettes of many varieties. The reliefs, presumably executed by Jewish artisans, are worked in a provincial style. On the whole they show a tendency to imitate Roman funerary symbols, combined with an Oriental stress on details (which are emphasized to the detriment of the general proportion); the composition is in the main heraldic. A third catacomb (No. 11), surmounted

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

by a mausoleum, had in the forecourt a mosaic with a design of fish; the mausoleum itself was decorated with eagles and an arched frieze with fighting wolves, a motif possibly showing the influence of the art of Central Asia.

The use of figural elements in burials closely associated with the chief rabbinical authorities of the time, as seen in the great necropolis of Beth Shearim, has gone far to dispel the



Beth Shearim, plan of Catacomb 20.

myth of the antipathy to art of normative Judaism, at least in its creative period.

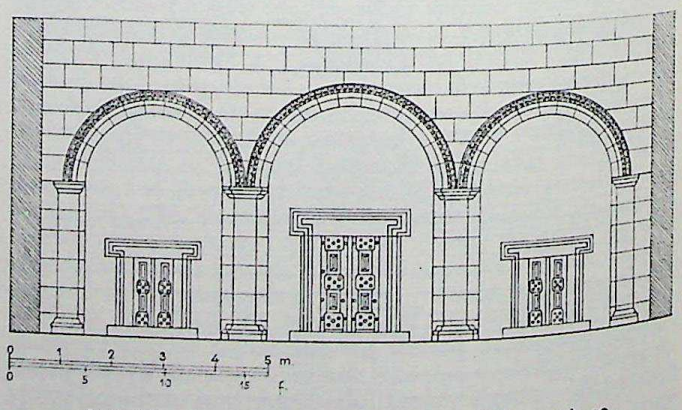
No survey of Jewish art in late Roman times would be complete that did not include the minor arts. In this category what has been preserved comprises chiefly a few ivory reliefs showing sacred objects, some glass vessels, and a number of lamps, mostly of pottery but some of bronze. The decorative motifs used are the Menorah — sometimes mistaken for the tree of life but easily identifiable when it appears in conjunction with the four other symbols, the ethrog, the lulab, the shofar (ram's horn), and the shovel (for incense?) — the Ark of the Law, the cluster of grapes, and the shrine. In their general development these examples of the minor arts follow the stylistic evolution of the late Roman period, gradually abandoning the classical freedom of design in favor of Orientalizing stylization, richness of detail, and severity of outline.

THE MIDDLE AGES. *Byzantium.* It is agreed among historians of art that the tendencies generally referred to as Byzantine appeared at a much earlier date than the beginning of the Byzantine period (4th–6th cent.), in the art of the Roman Empire. Here again Jewish art is in a special position. Since the Jews alone, of all the nations composing the Roman Empire, retained their religious identity in the Middle Ages, they might have been expected to maintain the traditions of antiquity longer than the nations which underwent a transformation on the ethnic or religious plane. The contrary is the case. Because of the closer contact of the Jews with the Oriental nations and cultures and their resistant attitude toward Greco-Roman culture, the typical transition to a medieval setting occurred earlier in Jewish art than in the art of the other peoples of antiquity. Evidence of this is furnished by the frescoes of the Synagogue of Dura-Europos (PL. 335). The synagogue and its paintings can be dated with reasonable certainty to the middle of the 3d century.

By a fortunate incident in the siege that led to the capture and destruction of Dura-Europos by the Sassanians in 256, the synagogue has been preserved in large measure. Almost the whole of its western wall, about half of the northern and southern walls, and a considerable portion of the eastern wall remain. The fact that the building was apparently used by an orthodox Jewish community lends particular interest to the way in which its walls were decorated: they contain depictions, in three registers, of Biblical scenes and personages, which draw upon the human image almost to the exclusion of other motifs. These pictorial representations form a most important link connecting the presumed Alexandrine cycle of Biblical illustrations and the later representations of the same scenes on mosaic pavements and in illuminated manuscripts. A connection of sorts had already been established between these disjointed phases of Jewish artistic tradition with the help of the Christian catacomb paintings and sarcophagus reliefs of the 3d and 4th centuries, but this connection was of necessity tenuous until the discovery of the Synagogue of Dura-Europos in 1931.

The community of Dura-Europos seems to have been one of the first to take advantage of the liberal decision of Rabbi Johanan of Tiberias in regard to the painting of figures on walls. The content of the paintings was selected from three points of view, or at least is divisible into three distinct types. The representations are in part symbolic, reproducing such motifs of the Jewish religion as the Temple façade, the seven-branched candlestick, the Ark of the Tabernacle, the Temple, and the high priest in his glory (PLS. 333, 336). A second group includes scenes that illustrate the salvation — through divine intervention — of Israel as a whole, or of individual persons: the Sacrifice of Abraham, the finding of Moses, the Exodus, the Waters of Marah, the liberation of the Ark from Philistine hands, David and Saul, Elijah and the Widow, the triumph of Mordecai (PL. 337). The third type can be said to reflect the hope of a national rebirth, as associated with the Messianic expectation: the tree of life, the blessing of Jacob, the anointing of David, Ezekiel's vision of the dry bones, and the Messiah in his glory. Thus the paintings of Dura-Europos represent a cross section so to speak, of the spiritual aspirations — both in Palestine and in the Diaspora — of the Jewish nation in the 3d century.

The form of these frescoes is hardly less interesting, from the point of view of art history, than their content. On the one hand, they anticipate several of the aspects characteristic of Byzantine art; on the other, they revive various elements obviously derived from the art of the ancient Orient. The composition features the grouping of images in well-defined units, or compartments, separated by strongly emphasized borders. These units hark back to the well-defined individual



Beth Shearim, reconstruction of façade of Catacomb 20.

pictures of manuscript illumination. Within the compartments the artists of Dura-Europos employed the method typical of the strip narrative, which is prominent in Assyrian reliefs and occurs again in Roman art of the 2d century (columns of Trajan and Marcus Aurelius). The figures are placed against a uniform background, with only a hint of such landscape elements as are essential to the narrative (e.g., the Nile in the story of

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

913

Moses, the rocks and trees in the vision of Ezekiel). The personages themselves are either juxtaposed or massed in large groups. Where necessary, a narrow strip in the foreground provides a kind of "downstage" area. The nearer figures are placed lower, the farther ones higher, with no other indication of spatial relations — a typically Oriental nonperspective organization of space. Another typical Eastern (more specifically Egyptian) feature is the exaggerated size of the principal personages: the relative proportions of Moses at the Red Sea are like those of the Pharaoh in Egyptian reliefs. The drawing is strictly linear, and isocephalism and frontality are observed throughout. It is the frontality — which seems to detach each of the actors from the scene in which he appears — that especially gives the frescoes of Dura-Europos their "Byzantine" character. Nevertheless, it should be noted that, along with the mannerisms of later art, these frescoes exhibit its characteristic strong points: directness and forcefulness of representation and narrative; freedom from distracting accretions; and intense spirituality of the figures, especially evident in the concentrated gaze. It is this spirituality that endows the four figures of Moses enclosing the central tableau with a force and a nobility that lift them into the sphere of genuine works of art.

The authorship of the Dura-Europos frescoes is still being ardently debated both as to the number of artists and as to their nationality. The theory that more than one artist was involved is based on a difference in dress. Two distinct types of male attire are seen: the Hellenistic chiton, himation, and sandals are worn by Moses, Elijah, and the Jews in general, whereas Pharaoh and Ahasuerus, Mordecai and Ezekiel as well as their entourage, wear belted tunics, trousers, and soft white boots — in short, Parthian riding dress. Most of the soldiers appear in scale armor, a few in Roman accouterments. It has been deduced from this evidence that there was at Dura-Europos one artist who followed the Hellenistic tradition and another who was influenced by Parthian art. However, since on closer study the details of the frescoes seem to be the work of one hand — or possibly of several closely related hands — it is a reasonable assumption that the paintings are the work of a master and several helpers. The master, who was especially meticulous in painting details, probably executed the Exodus and the crossing of the Red Sea and designed the other pictures, which were then completed by his assistants. There is a bare possibility that the paintings above the Torah shrine and the "tree of life" were executed by an earlier painter (PL. 333).

The frescoes of Dura-Europos seem to have established the following facts: (1) that there was a Jewish cycle of Biblical illustration, which was freely used even in orthodox circles; (2) that this cycle, while retaining some of the features of its presumably Hellenistic original, followed on the whole the rules of composition and arrangement of Oriental art; (3) that the cycle may have strongly influenced the development of the art of later periods, constituting — to use J. H. Breasted's telling phrase — an "Oriental forerunner of Byzantine art."

The continuation of the same tradition is to be observed in the mosaic pavements that have been preserved in various synagogues in Palestine and at least one in North Africa. This later group of pictorial representations should be examined, however, in the light of the general development of synagogue architecture during the 4th and 5th centuries of the current era. As has been noted, in the earlier synagogue the façade looked toward Jerusalem and the Ark of the Law was apparently transportable. This arrangement, emphasizing the direction toward Jerusalem by means of the large windows and the generally ornamental character of the wall facing toward the Holy City, had, however, the functional flaw that it obliged the worshiper to face about before beginning to pray. In succeeding periods, various experiments were made which led finally to the general adoption of the basilican plan, with a nave and two aisles, culminating in an apse directed toward Jerusalem. This new type of plan, based on a longitudinal axis, had the advantage of proper direction and of concentration on the focal point of synagogue worship, the Ark of the Law; it is the only type represented among the Palestinian synagogues of the 6th and later centuries.

Paralleling this change of plan was a change in the decorative elements used. It is true that we have no later counterparts of the wall painting of Dura-Europos — although to be sure the extant synagogue remains consist only of foundations and pavements, and some ornament seems to have been applied to the wall of the synagogue at Beth Shearim. As noted previously, mosaic decoration using images was allowed by Rabbi Abun in the 4th century. Actually there seems to have been some reluctance to take advantage of this permission, or a tendency to limit the images to symbolic ones or representations of the seasons, which had no religious connotation. Thus the synagogue at Naro (Hammam Lif) in Tunisia contained a mosaic pavement — parts of which are in New York (Brooklyn Mus.) — with a series of representations of symbolic import: a cantharus flanked by peacocks and palm trees, fish (an allusion to the story of Jonah?), and vine trellises (perhaps signifying paradise) enclosing a lion, birds, and baskets of fruit. In Palestine, too, the earlier pavements — for example, the one found at Isfaya — show images of the zodiac and the seasons, combined with a seven-branched candlestick, and a symbolic vine trellis. Soon, however, Biblical imagery found its way into mosaic representations. There developed in the 6th century a well-defined cycle of synagogue decoration, examples of which have been found at Na'aran ('Ain Duq) near Jericho, at Beth Alpha in the Valley of Jezreel (FIG. 915), and in Jerash, east of the Jordan. These pavements contain three main elements. There is a Biblical scene, usually taken from the same salvation cycle that served as the basis of the Dura-Europos paintings and that occurs also in the Roman catacombs. It is based on a liturgical setting, both Jewish and Christian, in which the various miraculous deeds of salvation are recorded (for the Hebrew version reference may be made to the Mishnah Taanith IV, 2). Thus at Na'aran the story of Daniel and the lion is depicted, at Beth Alpha the Sacrifice of Abraham (PL. 337), and at Jerash the story of Noah's ark. The second element, occurring at Isfaya, Beth Alpha, and Na'aran, is the zodiac, with representations of the seasons in the corners and images of the sun and moon in their chariots in the center. The third element is representation of the Ark of the Law, of the seven-branched candlestick, and of other ritual objects, flanked by lions, birds, curtains, and so on. So far as can be ascertained, the mosaic pavements follow closely the Biblical cycle as preserved in miniatures; for example, the Sacrifice of Abraham at Beth Alpha resembles in detail the presentation of the subject in the manuscripts of Cosmas Indicopleustes — both probably derived from the same Alexandrine tradition.

In the late 6th and the 7th century a significant change can be noted in the mosaic pavements of synagogues. The figural subjects tend to disappear, and the images are restricted to representations of the Ark of the Law (as in the late synagogue of Jericho), of the seven-branched candlestick [as at Jericho and Maon (Nirim)], and to images of lions or other beasts or birds [as at Hammath Gader (el-Hammeh) and Maon). Whether this aniconic tendency is attributable to internal Jewish development or to the Islamic invasion has been much debated. It is noteworthy that at Na'aran the zodiac images were carefully removed, whereas the Hebrew inscriptions accompanying them were left intact. This fact, taken together with the apparent destruction of the reliefs in the earlier synagogues by iconoclasts, since no damage was done to the buildings themselves, would seem to indicate that a wave of orthodoxy, directed particularly against images of human beings, swept over the Jewish communities in Palestine in the 7th century.

The style in which the mosaic pavements were executed is no less interesting than their subjects. Of course the mosaics vary exceedingly in quality, in accordance with the means of the local community and the capacities of the particular artist. Thus at one extreme are pavements such as that in Jerash, which was an important city of the Decapolis and probably had a wealthy Jewish community; the mosaics executed there compare favorably with the contemporaneous work of provincial Byzantine artists, although they are naturally much inferior to the work of the mosaicists at Constantinople. At the other extreme is the rustic work — probably by local artists,

UP State Museum, Lucknow

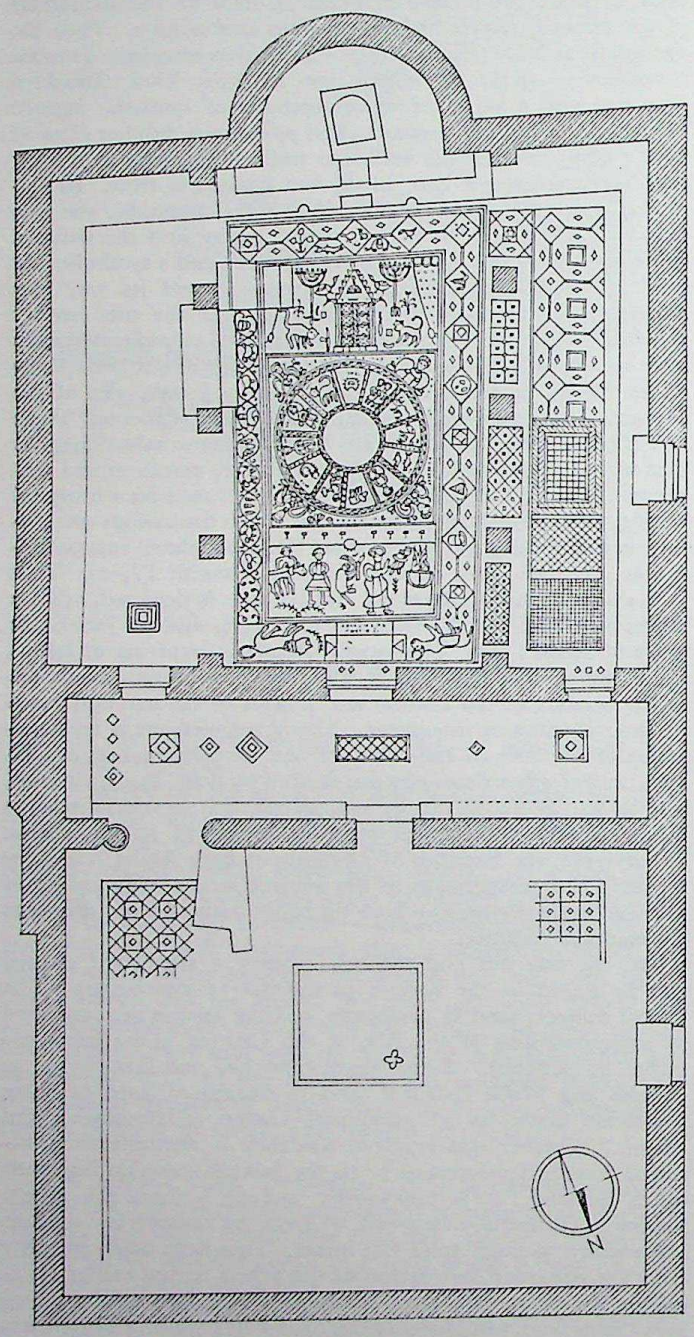
who proudly sign their names, Ananias and Marinus — at Beth Alpha, a small and insignificant village in Galilee. The Jerash mosaics have various characteristics typical of Byzantine art: frontality, a strip arrangement of the animals waiting to enter the ark, and so forth. The image of Daniel in the mosaic at Na'aran seems to have been executed in the typical orant pose. But in respect to style it is the better-preserved pavement at Beth Alpha that is the most interesting. Here are found, besides isocephaly and frontality, such characteristically Oriental ele-



Beth Alpha, plan of Synagogue showing mosaic pavement.

ments as arrangement of the component parts of an image side by side without regard to their true position, in an effort to render the image as complete as possible; exaggeration of the parts of the body especially important for conveying expression (e.g., head and eyes); uniform background; combination of several episodes of a story into one picture; the abbreviated character of various elements. Nevertheless, what has been said of the sculptures at Beth Shearim can be said without hesitation of the Beth Alpha mosaics; they represent the same vital, if somewhat naïve, trend of Jewish popular art. The synagogue pavement discovered in 1957 in Maon is interesting for another reason: in general composition and details it closely resembles a church pavement found at Shellal in the Gaza region, and dating from the second half of the 6th century. The Jewish pavement, which seems to have been somewhat later, shows the same arrangement in outline, with a trellis issuing from a crater flanked by peacocks, and various animals grouped symmetrically around a central axis; the main difference is the introduction of a seven-branched candlestick flanked by lions and palm trees, in the top center. The way in which the Jewish artist transformed and simplified his prototype, while bringing it nearer to the Byzantine style of later works, exemplifies the generally prevalent trend of Jewish art toward the Orient.

Islamic countries. At the beginning of the Middle Ages, with the Islamic conquest, which extended from Spain to India, the Jewish communities were split into two groups. One, in which the Spanish Jews soon assumed a preeminent position, was strongly influenced in its art by Islam, while the other, which remained under Christian rule, followed European developments through the Romanesque and Gothic periods. Because of the catastrophe that befell Spanish Jewry at the end of the 15th century and the general decline of the Moslem countries, less information is available on the artistic activities of the Jewish communities under Islam than on those of Germany, France, and England. In Italy both Islamic and Christian influences were strongly felt.

It was only natural that Islamic rule should reinforce among the Jews the anti-iconic tendencies always latent in their religion. Since they lived dispersed in small groups, they were more amenable to external influences (as were also the Jews dispersed in Christian countries) than the comparatively densely settled Jewry of Byzantine Palestine. Thus the artistic traditions handed down in the Jewish communities under Islam were expurgated of all representations of living beings, and even of plants, and tended more and more toward the geometric arabesque as the sole source of ornament.

The divergence in artistic development between Jewry under Islam and Jewry under Christian rule was manifest in the planning of the synagogues, the only buildings of a specifically Jewish character and hence the sole representatives of Jewish architecture of the period. Spanish — and, in general, Eastern — Jews followed the late Palestinian tradition, in which the focal point of the synagogue was the Ark of the Law firmly set up in the wall facing toward Jerusalem, that is, they favored the basilican type, with several rows of columns perpendicular to the wall opposite the entrance. This tradition predominates in the two Spanish synagogues of Toledo. Although erected under Christian rule — one in the second half of the 12th century and the other in 1356 — they nevertheless reflect Arab influence, Spanish Gothic appearing only in minor details. The earlier synagogue has a flat roof and four arcades with horseshoe arches dividing it into five aisles. Its simple exterior contrasts strongly with the rich decoration inside, in particular the carved capitals and the glazed tiles at the base of the pillars. The later synagogue (which has since become a church, El Tránsito) is similar in plan; especially remarkable are the walls, embellished with rich arabesques cleverly blended with decorative Hebrew inscriptions, and the latticed partition between the main hall and the women's gallery.

In the minor arts, Jewish (as well as Christian) craftsmen played a most important part under Islam; however, since they succeeded in adapting themselves to the rules of Islamic art to a remarkable extent, their work can be distinguished with certainty only when it bears a Hebrew inscription. Noteworthy in the field of the minor arts is the granulated and filigree work of the Yemenite Jews, who continue to this day the traditions of medieval craftsmanship. A few examples of carvings in wood, on which Hebrew inscriptions remain, survive from Fatimid Cairo (10th–11th cent.). The glass industry was from its beginnings largely in Jewish hands, but only a few objects marked with Hebrew lettering furnish a clue to their provenance.

Jewish artistic activity under Islam in the Middle Ages must

917

ultimately be judged, therefore, by the illuminated Hebrew manuscripts that have come down to us from the Orient and from Spain. In these the decoration is strictly aniconic, continuing and strengthening tendencies which had already appeared, as has been noted, toward the end of the Byzantine period. However, there is an interesting exception to be noted: a group of Persian-Jewish miniatures that illustrate the Biblical narrative with extremely vivid and colorful representations in which figural images play the principal part. The artists have adapted Persian costumes, arms, and ways of fighting to the Biblical story, adding the Hebrew explanation underneath.

But aside from these exceptional Persian manuscripts, the Hebrew manuscripts produced in Islamic countries either are not illuminated at all — and here the influence of the Pentateuch manuscripts, used for worship, in which any kind of ornament was strictly forbidden, is apparent — or, at the utmost, have only a decorated title page, in which the ornament is based almost exlusively on arabesques. One such title page, from a Pentateuch completed in Yemen in 1469 (London, Br. Mus., Ms. Or. 2348), combines with the usual arabesques stylized representations of mountains formed by a scale pattern, a six-petaled rosette, and what seem to be vestigial images of fish — all these forms made up of minutely written texts. The only exception to the strict eschewal of figural art is the representation of objects used in worship in the Temple, the synagogue, or the Jewish home found in manuscripts that seem to be the work of Karaites (members of a heretical sect that separated from Judaism in the early Middle Ages). Thus in a Pentateuch in Leningrad dated 930 (State Lib., Cod. II. Firk. 17) the Temple gate (or the Gate of the Tabernacle) is shown below a seven-branched candlestick, above which is an Ark of the Covenant; it should be noted, however, that the images of the cherubim above the ark are replaced by two little golden leaves. The other objects represented (vessels, lavers, a table) are placed, according to the canons of Oriental art, in full profile, one above the other, against a neutral background. In another Karaite manuscript similar objects appear against a background curtain with a geometrical pattern enclosed in an ornamental border formed by a Hebrew inscription.

Islamic influences manifest themselves with special clarity in the manuscripts produced in Spain; this country having passed from Moslem to Christian rule, the development of its art as reflected by Jewish artists makes possible the isolation of the various elements with particular exactness. On the whole, Spanish manuscripts repeat the Islamic pattern of arabesque in complicated designs occasionally resembling those on woven carpets. The appearance of what seem to be Gothic windows in a Spanish haggadah of the 14th century (London, Br. Mus., Ms. Or. 2884) shows a certain degree of penetration by other influences. But even when the representation of objects is allowed (as in the Pentateuch known as the "Farchi Bible," completed 1382; Letchworth, Coll. D. S. Sassoon), the use of images of human beings is still strictly prohibited. This sometimes leads to paradoxical results: we see the tents of Jacob and his wives, but not the patriarch or his womenfolk; in the story of the men sent to spy out the land of Canaan, the giant cluster of grapes is reproduced, but not the men who carry it; the scarlet thread marking the window through which the messengers enter Jericho is shown, but not the messengers; and so on.

The evaluation of Jewish elements in the art of Islamic countries is especially difficult precisely on account of the fundamental agreement between the two religions. Because Islam pressed to finality tenets latent in Judaism, it is far from easy to arrive at a clear-cut distinction between the two cultural forces. It can therefore be seen why Jewish art, as an identifiable entity, vegetated in Islamic countries, whereas in contemporary Europe it was strongly stimulated — by the very contrast between church and synagogue.

The European West. In the Middle Ages the Jewish artists of the West were drawn in two directions: they felt, on the one hand, a strong attraction to the splendid examples of Romanesque and Gothic art which were being created before their eyes; on the other hand, they were bound by restrictions imposed on them partly by a hostile church and state and partly by the community leaders who were their patrons. It is this polarity that lends medieval Jewish art its particular interest. In judging its products we do well to keep in mind the external circumstances under which they were produced. The Jewish communities in the Middle Ages were small and scattered; their means were therefore for the most part limited, and they did not need large and expensive rooms for worship. The Jewish tradition of the Diaspora, as exemplified at Dura-Europos, obliged the communities to keep the synagogues as inconspicuous as possible (in direct contrast to the Palestinian synagogues, which were erected — as the Law commanded — in the most prominent place in the town). The church edicts also ordered that synagogues be built low, their existence being simply tolerated; the Jews' acceptance of this circumstance was based on the Psalmist's worship of the Lord "out of the depths" (Psalms 130:1).

Jewish architecture in medieval Europe was limited almost exclusively to synagogue building. In contrast to Spanish usage, which focused the ritual on the Ark of the Law, placed at one end of the building, the custom adopted by the French and German Jews was in the older, Palestinian tradition of a movable Ark; the focal point was a raised platform (almemar, or bema), placed in the middle of the hall, around which the worshipers were grouped. Another architectural problem was the situation of the women's section; since the synagogue building had to be kept low, there was no place for the high gallery of the earlier synagogues. In consequence, the women's section was placed either on the same level as the main prayer room or, in two-storied synagogues (such as that of Carpentras, near Avignon; 1396), below it.

Medieval synagogues are in general of two types: those in which the vaults are supported by central columns, usually two, dividing the synagogue into two aisles, and those in which the vaulting is not supported centrally. The two-aisled type, which imitated the town halls and refectories of medieval Europe, apparently had two advantages: it made possible the avoidance of the basilican plan, which was associated with churches; and it afforded an opportunity for the felicitous placing of the bema between the two central columns of the hall. This type of building must have recommended itself to the Jewish architect as well as his patrons for its small proportions. The earliest extant two-aisled synagogues belong to the Romanesque period and have rounded vaults on piers; the later ones date from the 13th or 14th century, and have the pointed ribbed arches and other features of well-developed Gothic architecture.

To the earlier group belongs the Synagogue of Worms, in Germany, founded in 1034 (PL. 335). It has a main hall with six cross vaults resting on two columns; the capitals, doors, and other architectural ornament closely resemble those of the contemporary Cathedral of Worms. The women's section, added on the same level in 1213, has a single central column and four cross vaults. In the same complex there is also a ritual bath, built in the customary way, deep into the ground. Two other examples of the two-aisled type are the Regensburg Synagogue (late 13th cent.), with three central columns, built in a style transitional between Romanesque and Gothic, and the smaller synagogue in Eger in northern Bohemia, in which the vault was supported by one pillar in the center of the hall. The most remarkable of these buildings is the legendary synagogue of Prague, the Altneuschul (Old-New Synagogue), erected at the end of the 13th or the beginning of the 14th century. Situated in the center of an extensive ghetto, the Altneuschul could be less inconspicuous than other contemporaneous synagogues; it rises to a prominent height, and its exterior as well as its interior is ornamented. It is typically Gothic in style; heavy buttresses take the stress of the arches on the outside. The entrance is on one side. In the interior, two piers support pointed vaults with five ribs. The fifth rib is thought by some to have been added as a means of avoiding the Christian associations of the four cross ribs, but this is speculative: the unusual five-rib arrangement occurs again in the small 14th-century Gothic synagogue of Miltenberg (Germany), but the

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

Old Synagogue in Kraków (Poland), erected in 1364 on the same plan as the Altneuschul, has the normal Gothic four-ribbed vault. The wide range of occurrence of the same type of building — from Worms near the Rhine to Kraków, by way of Germany and Bohemia — is an indication of the cosmopolitan character of Jewish medieval architecture. This is not surprising, considering the close bonds that existed between the widely dispersed Jewish communities; it is, moreover, quite in accord with the generally unified character of medieval culture.

The second type of medieval synagogue, in which the vaulting covers an undivided hall, is chronologically concurrent with the two-aisled type. Selection of one type in preference to the other probably depended upon the relative size of the community concerned. In any case, the unitary type afforded a simpler setting for the ritual — that is, the two focuses (the Ark of the Law and the bema) did not have to be separated as in the two-aisled synagogue. The unitary vaulted hall appears in both Romanesque and Gothic styles. Two noteworthy examples are the Synagogue of Miltenberg, already metioned, and the one in Bamberg. The latter is slightly earlier (13th cent.), but has, nevertheless, a Gothic type of vaulting; it is also remarkable for its elongated proportions and because the women's section adjoins the main hall longitudinally.

Illuminated manuscripts of all kinds (prayer books, ethical treatises, haggadahs, etc.), commonly found in richer households, constitute another main aspect of Jewish art. Here too occurs the eternal struggle between the iconic and the aniconic. Spanish-Islamic influence, particularly strong in Provence and in Italy, was allied, of course, with the traditional Jewish aversion to images. In Italy, however, the aniconic tendency came into conflict with the general trend of medieval art, which, in the end, proved too strong for the Jewish illuminators to resist. But at least they made a brave attempt to keep as close as possible to the letter of the law. Thus in a prayer book (mahzor) of 1272 (Jerusalem, Jewish Nat. and Univ. Lib.; formerly Worms Synagogue) there is a representation of a hunt in which the hunter is dog-faced; in another prayer book, of the 13th century (Oxford, Bodleian Lib.), a bird-faced Abraham sacrifices an Isaac bound on the altar in the guise of a ram. In certain cases the artists applied their principles selectively; for example, in a haggadah in Jerusalem (Bezalel Nat. Mus.) all the Jews are represented with heads of birds, whereas the Gentiles appear in normal human form. Traces of this tendency are still visible in the Sarajevo Haggadah (14th-cent.; Sarajevo, Nat. Mus.), one of the best examples of medieval Jewish miniature art, in which all the figures have the usual human appearance, but the angels on Jacob's ladder cover their faces with their wings. This haggadah contains clear evidences of the dependence of its artist on French miniature art. Similar influences can be detected in a manuscript dated 1277–78 in the British Museum, in which the slender figures, delicately bending forward, and the exquisite drawing are obviously derived from French Gothic art. German manuscripts are generally more robust in style and are often characterized by the introduction of elements of the grotesque. The title page of the Worms prayer book of 1272 shows the image of Jerusalem restored (modeled after a typical Gothic city) and, below, two wolves, their tails bound together in a knot, gazing with symbolic rage at the Holy City above. Another particularity of the medieval manuscripts is the outlining of figures of animals (lions, etc.) by means of minutely written textual commentaries on the Bible (Masorah). These point to a dominant desire for some kind of figural decoration; at the same time, the transforming of these commentaries into ornament seems to indicate the neglect into which their study had fallen at the time. The finest of the medieval manuscripts is the so-called "Kennicott Bible" of 1476 (Oxford, Bodleian Lib., Cod. Kennicott 1), written and illuminated in northern Spain; it represents both lines of Jewish manuscript tradition, containing, as it does, both elaborate arabesques, including the Shield of David, and marginal representations, such as that of King David in his glory, shown in the guise of a medieval monarch, and Jonah being thrown into the sea from a typical caravel. Rich manuscripts of this type were also produced in Italy; such examples as the Rothschild manuscript from the end of the 15th century (Jerusalem, Bezalel Nat. Mus.), show the clear and abiding influence of Renaissance art.

Michael Avi-Yonah

THE MODERN ERA. Until the 19th century, Jewish art was created primarily to serve the synagogue and the Jewish community and was limited mainly to illuminated manuscripts and ceremonial objects. While always employing the prevailing art styles of their countries of residence, Jewish artists adapted these styles to conform to the specific religious purposes of their works.

The relatively favored status that Jews enjoyed as loan bankers in 15th-century Italy — which had enabled them to acquire and to commission some of the finest illuminated Hebrew manuscripts — gradually deteriorated with the steady decline of the economic and political foundations of many of the Italian city-states, particularly in the late 16th century. At the same time, Venice was achieving preeminence as a center of wealth, culture, and learning, and its Jews, though residing in ghettos, participated in the flourishing cultural life. This participation was reflected in the Jewish art and architecture of 16th- and 17th-century Venice.

A superb example of the many baroque synagogues built in the Venetian Republic during this time is the Tempio Israelitico Spagnolo (Scuola Spagnola) of the Ghetto Vecchio in Venice, in the section where the aristocratic Spanish-Portuguese Jews resided. Constructed toward the end of the 16th century, it was enlarged and rebuilt in 1665 by Baldassarre Longhena. Its plain exterior encloses a lavish, grandiloquently baroque interior, with marble Corinthian pillars, flamboyant chandeliers, and a gilt and stucco-incrusted ceiling; it is rectangular in shape with an oval-shaped women's gallery.

In addition to building richly adorned synagogues, many prosperous Jewish communities in the Venetian Republic commissioned rich ceremonial objects for use in the home and in the synagogue (PL. 338). These objects are highly valued because of the dearth of earlier examples. Particularly attractive are the gold and enamel betrothal rings, the brass Hanukkah lamps decorated with standard Renaissance motifs such as putti, centaurs, and nymphs, and the illuminated marriage contracts.

In 17th- and 18th-century Germany there emerged a small group of privileged individuals — the Court Jews — who functioned as provisioners of the princes' armies and as suppliers of luxury goods for the nobility. Their special status, with its accompanying privileges, enabled the Court Jews and their immediate circles to donate elaborately embroidered Torah curtains, mantles, and ceremonial objects in precious metals to their synagogues and to commission ceremonial objects for their own private use. Since Jewish craftsmen were excluded from the guilds, most of the ceremonial objects were executed by Christian silver- and goldsmiths; the foremost craftsmen of Augsburg, Nuremberg, and Frankfort are represented. The pompous, heavy baroque style of the 17th century and the more elaborate, delicate rococo style of the 18th century are apparent in these works. Among the typical pieces are silver spice boxes (used in the habdalah ceremony at the conclusion of the Sabbath) in the form of town-hall towers with large clocks and weather vanes, and graceful wine goblets for the holidays. Other legacies from these communities are exquisite silver Torah breastplates with intricate floral and animal decoration, produced by the master craftsmen of Nuremberg and Augsburg, and 18th-century Torah crowns, in graceful three-tiered, hexagonal turret form, with bells set in arches within each tier, made by such masters as Jeremias Zobel of Frankfort on the Main.

Eastern Europe, and especially Poland, is a significant area in the history of Jewish art. During the 16th and the early 17th century, Poland contained the greatest concentration of Jews in Europe and was one of the main cultural and religious centers of European Jewry. The Jews of Poland were intimately involved in the rise of its prosperous feudal towns; they functioned as merchants and as managers of vast estates for the nobility; they levied customs duties and collected road tolls. Jewish culture flourished, and with it the development of synagogue architecture. During this period some of the larger

towns of Poland saw the construction of many synagogues. Usually of stone and brick, these were often privately endowed by wealthy Jews, and many of them had fortresslike exteriors with thick, heavily buttressed walls and high parapets with embrasures and loopholes for defense purposes. During the 16th century, when the influence of Italy was strong in Poland, some of the stone synagogues were built by Italian architects; for example, the Taz Synagogue of Lvov (1582), a nearly square vaulted structure, was designed by Paolo Romano. The Maharshal Synagogue, built in 1567 in the important commercial city and Jewish center of Lublin, was especially significant in the development of later Polish synagogue architecture. Unlike the Italian synagogues, where the bema was characteristically placed next to the western wall, the Maharshal Synagogue had the bema in the center of its spacious hall, thus constituting its dominating element. The bema was enclosed in a vaulted tabernacle with four supports, of three clustered columns each, which carried the vaulting of the entire synagogue. Most of these synagogues were razed during the uprising and invasion of 1648 and the ensuing massacres and persecutions of the Jews, events symptomatic of the general breakdown of Poland's feudal economy.

The destruction of Poland's major centers of Jewish settlement and the Jewish exodus from the cities had a marked effect on the artistic output of the Jews. Relocating in Polish towns and villages in the late 17th and the 18th century, many Jews turned to employment in local trades and crafts. Finding an abundance of timber, these local Jewish craftsmen, whose names have occasionally come down to us, built synagogues of wood, with the aid of the Jewish population of the villages. Most of these fine examples of Jewish folk art were destroyed during World War II.

The exteriors of these wooden synagogues, with their many-tiered, hipped roofs are scarcely less interesting than their interiors. As in the masonry synagogues, the bema was placed in the center of the synagogue, but it was not required, since the lightness of wood allows for greater freedom of construction, to support the ceiling. Thus the bema had no functional part in the architectural construction, and the ceilings of the square rooms were imaginatively vaulted with tentlike structures and cupolas. The decorative effect was further heightened by polychrome paintings in which floral and arabesque designs were entwined with signs of the zodiac, musical instruments, animals, naïve visions of Jerusalem, and tablets with Hebrew inscriptions taken from the liturgy and rabbinic literature. All this produced the effect of a richly woven fabric. In the 18th century, the bema, and, more especially, the shrine for the Torah were intricately carved. Large wooden structures with wings and columns, the Torah shrines sometimes featured two rampant lions flanking the tablets inscribed with the Ten Commandments; often the entire Ark was covered with an intricately carved labyrinth of animals and tendrils in interlaced designs similar to those used in paper cutout work. Of the Polish Jewish folk artists who produced the decoration of these houses of worship, Eliezer Sussmann (18th cent.) is particularly noteworthy; he painted the interiors of wooden synagogues not only in Poland but in southern Germany as well.

The ceremonial objects produced by Jewish gold- and silversmiths who flourished in such cities as Lvov are also notable for their floral decoration and whimsical naturalistic ornament (e.g., a bear climbing a tree to reach a honey pot). The spice boxes for the habdalah ceremony appear in a great variety of forms: birds, trees, flowers, fish, and fruits.

Although this period was marked by a gradual decline, beginning with the mid-17th century, in the status of Polish Jewry, it produced some of the finest examples of Jewish folk art.

In the Netherlands in the 17th century and in England in the late 17th and 18th centuries, Jews were encouraged to engage in international trade and commerce. The thriving Jewish communities soon built synagogues; notable among these is Amsterdam's Portuguese (Sephardic) Synagogue, built in 1675 by the Dutch architect Elias Bouman. Dignified and austere in design, like the neighboring Calvinist churches, the synagogue is divided into a nave and two aisles by the high Ionic columns that support the barrel vaultings. In this synagogue the focal point shifts from the bema in the center to the Ark — on the eastern wall — which is of the cupboard type, with doors resembling the reredos of northern baroque church altars. A women's gallery upheld by 12 low Ionic columns projects from the three other walls, partly filling the outside aisles. The design of this Sephardic synagogue influenced London's Bevis Marks Synagogue, built in 1701, though the London structure mainly followed the dominant style of English meetinghouses.

In the realm of painting, portraits, which were popular among both Jews and non-Jews in the Netherlands and England, were occasionally commissioned of Jewish artists; two portraitists of some ability were Salom Italia, an Italian Jew who engraved portraits in Holland in the middle of the 17th century, and David Estevens, a Danish Jew who worked in 18th-century England.

Elegant ceremonial ornaments in silver, especially those for the adornment of the Scroll of the Law (Torah), were fashioned in the Netherlands in the 17th-century. These ornaments, with their baroque turret form, were often modeled after Dutch church towers. It was unusual at this time to find skilled Jewish silversmiths outside eastern Europe. An exception is the Dutch Jew Abraham de Oliveyra, who, working in England in the early 1700s, fashioned some delicate ceremonial objects based on Dutch models. Carved tombstones, unusual for Jewish cemeteries, were produced in the Netherlands in the 17th and 18th centuries for the Sephardic Jewish cemetery in Ouderkerk, near Amsterdam. These elegant horizontal tombstones, probably carved on commission by Christians, have Biblical scenes sculptured on them. Thus the tombstone of one Rachel Teixeira, who died in childbirth, depicts the Biblical Rachel on her deathbed, being mourned by her family (a scene probably influenced by representations of the Death of the Virgin) and uses such Humanistic symbols as the putto with the death's head, signifying the transitoriness of life.

Any brief treatment of Jewish art in Europe from the 16th to the 19th century is essentially a review of European art as adapted to Jewish life, since, with the notable exception of eastern Europe, this art was for the most part created by non-Jewish artists. The few Jewish artists of western Europe who appear on the record hardly ranked above the average.

With the beginning of the 19th century, the term "Jewish art" becomes ambiguous. The French Revolution had encouraged both Jews and non-Jews to adopt a national identity in addition to a religious one. Moreover, the abolition of medieval guild restrictions enabled the Jew to study art, while his status as a citizen motivated him to contribute his artistic talents to his nation rather than to his particular religious community. Although, as previously noted, portraiture had manifested itself among Jews prior to the French Revolution, it was not until the 19th century that the artist of Jewish origin could free himself from strict subservience to Jewish religious needs and pursue art as an independent discipline. Hence, the record of Jewish participation in the art of the 19th and 20th centuries becomes the history of the contributions of professional German, French, Dutch, and American artists of Jewish origin to the general development of Western art. Few of them have been particularly concerned with Jewish subject matter.

In Germany, early in the 19th century, Moritz Oppenheim (1800–82), one of the first successful Jewish painters, produced a series of genre scenes called "Pictures of Traditional Jewish Family Life," which were somewhat saccharine and shallow. Later in the century, in eastern Europe, artists of Jewish origin — such as Samuel Hirszenberg (1865–1908) and Isidor Kaufmann (1853–1921), who had received their training in the academies of Germany and Austria — also attempted to give visual expression to the Jewish scene. Their minutely realistic narrative renditions of Jewish life in eastern Europe, full of pathos and sentiment, were popular in their day despite their lack of genuine depth of feeling or sincerity. Out of this eastern European school came Baruch (Boris) Schatz (1866–1932), who in 1906 voluntarily left his post as the head of the Bulgarian Academy of Fine Arts in Sofia to help establish the Bezalel School of Arts and Crafts in Jerusalem, which had as its primary

aim the fostering of a Jewish art. This aim, although in consonance with the emerging Jewish nationalism, proved unrealizable because western European art was already severing its ties with nationalistic goals.

Nonetheless, several modern artists have succeeded in refracting in their art their specific Jewish religious and cultural background. Foremost among them is Marc Chagall (q.v.), a painter influenced by the cubist school, whose imaginative poetic flights of fancy, drawing heavily on his early childhood experiences in Russia, are firmly rooted in the Yiddish folk idiom. Max Weber (q.v.), one of the outstanding pioneers of modern art in America, conveys, in the elongated, distorted figures and faces of his Talmudists and Hasidim (whom he portrays with poignant lyricism and vibrant color) some of the ecstatic and spiritual intensity of these scholars. These artists, in a genuine rather than an artificial response to a resurgence of ethnicism, attempted to strengthen their ethnic identity by seeking out Jewish motifs.

In modern Israel art is little influenced by such European Jewish experiences as ghetto life and worship; religious subject matter, in fact, is rarely treated. Many prominent Israeli artists paint the picturesque sights of the country and its people, using postimpressionist, Fauvist, and expressionist styles; especially among the younger generation there is evidence of great interest in the nonobjective idiom.

JONES, INIGO. The English architect and scenographer Inigo Jones was born in London in 1576 and died there June 21, 1652. According to his pupil John Webb (the chief authority for the architect's early life), Jones early visited Italy, including Venice, whence he was called to work for Christian IV of Denmark. The earliest documentation of Jones in a capacity connected with the arts is a mention of him as a "picture maker," dated June, 1603, in the household accounts of the Earl of Rutland, who was about to leave England as ambassador to the Danish court. For Anne of Denmark, the wife of James I of England and sister of Christian IV, Jones designed a masque that was presented in January, 1605. There survives a continuous series of designs that he executed from 1605 until the 1640s, when, after the outbreak of the English Civil Wars, the masques were no longer performed.

Between 1605 and 1613 Jones was responsible for the staging of nine court masques, a series of entertainments in the hall at Christ Church College, Oxford, and a presentation for the Earl of Salisbury on the occasion of the opening of the Earl's newly built "Britain's Burse" (New Exchange) in London's Strand. There is little sign that Jones was engaged in architectural activity during this period, although he was concerned in the design of Lord Salisbury's building in London and was responsible for some change in the design of the south front of the Earl's new house at Hatfield in 1609–10. In January, 1611, Jones was appointed surveyor to Prince Henry, the eldest son of the King, but the only buildings known to have been carried out in that capacity are a number of small works for the gardens at Richmond. Nevertheless, this appointment marked the recognition by the court of Jones's suitability for purely architectural employment. A notation in Jones's copy of Vitruvius' *De Architectura* (conserved at Chatsworth, Derbyshire) mentions a visit to Paris in 1609.

Drawings in various quantities survive for seven of the masques and entertainments presented before 1613; the others of this period are known only from descriptions in the printed text published by the authors of the masques. The most famous of these poets were George Chapman and Ben Jonson. Jones's association with the latter was to be a long and stormy one. There is other evidence of Jones's circle of acquaintance at this time (1610–11), which included the poet John Donne and Lionel Cranfield, later Earl of Middlesex, for whom Jones designed a gateway (1621) that still survives.

Jones made a second visit to Italy in the suite of the Earl and Countess of Arundel. They visited Milan, Parma, and Padua and arrived in Venice on July 20, 1613. They proceeded to Vicenza, Bologna, Florence, Siena, Rome, and Naples. Jones left his companions in Genoa and made a further visit to Venice in July and August, 1614, when he met the Italian architect Vincenzo Scamozzi (1552–1616). From Venice Jones went again to Vicenza, and he was back in London by January, 1615.

A sketchbook preserved at Chatsworth and notes in his copy of Palladio's *I Quattro Libri dell'Architettura* (Oxford, Worcester College) indicate Jones's concerns during this Italian visit. They were of two kinds: a predilection for the antique that took precedence over his interest in more recent or even contemporary Italian architecture and an interest in the work of Guercino (q.v.). Indeed, the sketchbook contains a portrait of the Italian painter and a Guercino-like drawing (dated May, 1614) of the Castel S. Angelo in Rome.

In September, 1615, Jones succeeded to the office of Surveyor to the Crown. This appointment determined all the architect's later career. The office, which made him the architect of any important new building project undertaken by the Crown, also made him responsible for much minor work of maintenance and alteration to royal residences and entailed a considerable amount of administrative work. But his new position allowed him to work for distinguished courtiers in a private capacity.

There is abundant documentary evidence of Jones's activities in various fields during the three and a half years from his appointment as Surveyor and the beginning of the best-known of his large surviving works, the Banqueting House at Whitehall (II, PL. 147). In 1618 he again designed the scenery and costumes for a masque by Ben Jonson. A close connection with Lord

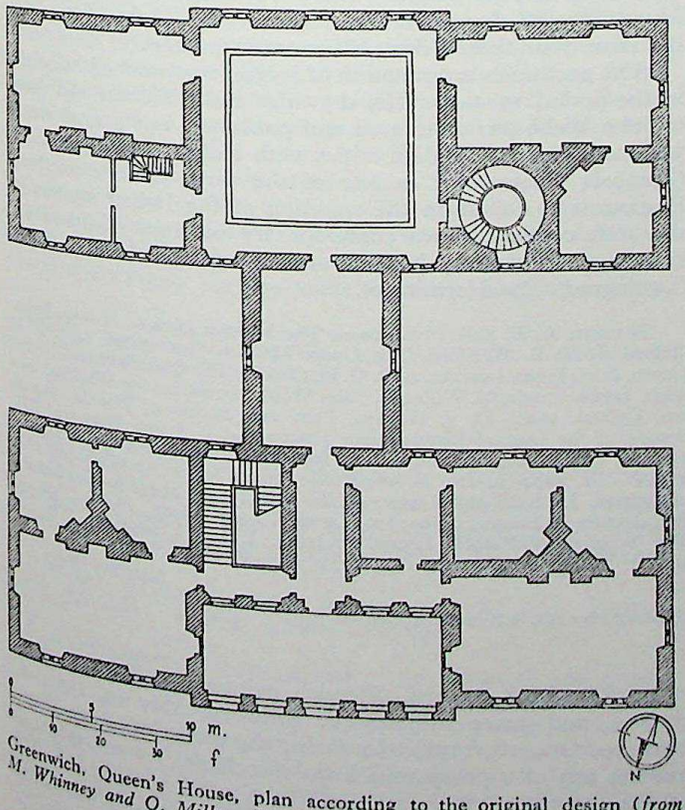
925

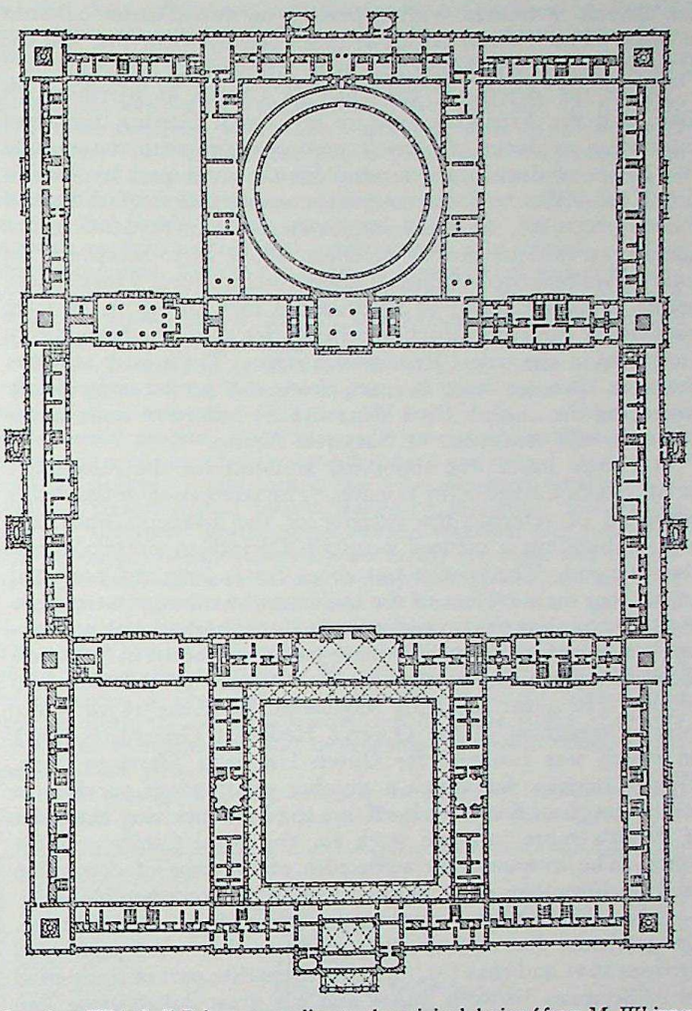
Arundel continued; Jones was associated with the Earl's activities as a collector of pictures and sculpture, and the architect did some work at Arundel House in the Strand.

An architectural work of great importance was undertaken by Jones in this period — the Queen's House at Greenwich (begun 1616; FIG. 925; PL. 340). This was a large pavilion about 120 ft. square contrived in two rectangular parts, one on either side of the Woolrich-Deptford road. The two buildings were designed as one and linked by a bridge across the road. (The position of the road, which was later filled in, is marked by the two 19th-century colonnades flanking the house). The work continued until 1618 and seems to have reached the top of the ground floor when it was abandoned for ten years. It is clear that the general conception of the building, both in plan and construction, belongs to the early period and only the internal finishing to the years 1629–35. It has been noted that the plan bears a marked resemblance to that of the villa (1480–85) Giuliano da Sangallo designed for Lorenzo the Magnificent at Poggio a Caiano, Italy, and that the long, comparatively low proportions of the Sangallo villa may have served as a precedent for the proportions of Jones's work. Another Italian precedent, one acknowledged by Jones himself, was the Villa Dondi dell'Orologio (near Padua), which Scamozzi designed (1597) for Niccolò Molini. From this structure Jones derived several features in addition to the relation of the pilasters to the columns, which he mentioned. Apart from its situation over a public road, the plan of the Queen's House, in which the relations and proportions of the rooms are based on definite arithmetical ratios (the result of Jones's study of Palladio), was something new in England.

The death of Queen Anne (1619) postponed indefinitely any hope of completing the building at Greenwich, and Jones turned to the rebuilding of the Banqueting House at Whitehall, which had been destroyed by fire that year. The rebuilding was begun in June, 1619, and completed by 1622. The building consists of a single great hall (in the form of a double cube), 110 by 55 ft. and 55 ft. high, that was raised on a low undercroft. The predominant Italian influence in the building is that of Palladio, and a Palladian precedent can be found for almost all the motifs employed in its design. For all their importance, the Palladian influences in the Banqueting House design have been assimilated and subtly transformed. The mannerist elements in Palladio have been minimized, and the broader proportions of the building in relation to its height give a more classical, almost High Renaissance calm to the structure.



Greenwich, Queen's House, plan according to the original design (*from M. Whinney and O. Millar, English Art 1625–1714, Oxford, 1957*).



London, Whitehall Palace, according to the original design (*from M. Whinney and O. Millar, English Art 1625–1714, Oxford, 1957*).

Two other buildings survive from the 1620s, the Queen's Chapel at Marlborough Gate (1623–27; London, St. James's Palace) and the entrance front of Castle Ashby, Northamptonshire. The Queen's Chapel is a small building with a coffered barrel vault of wood that gives the interior an air of antique gravity (PL. 339). This is the only interior in which Jones's lifelong preoccupation with antiquity can be fully appreciated. This predilection is also reflected in the building's exterior. The entrance front to Castle Ashby must, on the evidence of its heraldry, date from before 1631. This is not a documented work, but its date, technical accomplishment, and resemblance to other Jones designs of a few years later make Jones's authorship reasonably sure. The entrance front comprises a screen and arcaded loggia surmounted by a long gallery and closes the fourth side of an earlier courtyard. This structure closely resembles Jones's designs for Whitehall and Somerset House that are known from drawings of the late 1630s.

The 1620s was a period of varying activity for Jones, both in architecture and theatrical designing. He made designs for five masques between 1622 and 1626, and the drawings for them include some striking examples of his new Guercinesque manner of drawing.

During the 1630s he undertook many projects. In 1631 he was employed by the Earl of Bedford to lay out the grounds to the north of the garden of the Earl's house in the Strand. There Jones built the piazza of Covent Garden, of which little remains of the original. The piazza was surrounded on two sides by buildings that had arcaded walks at ground level. The third side was occupied by the east front of the church, which was flanked on either side by symmetrical pavilions. The front of

UP State Museum, Lucknow

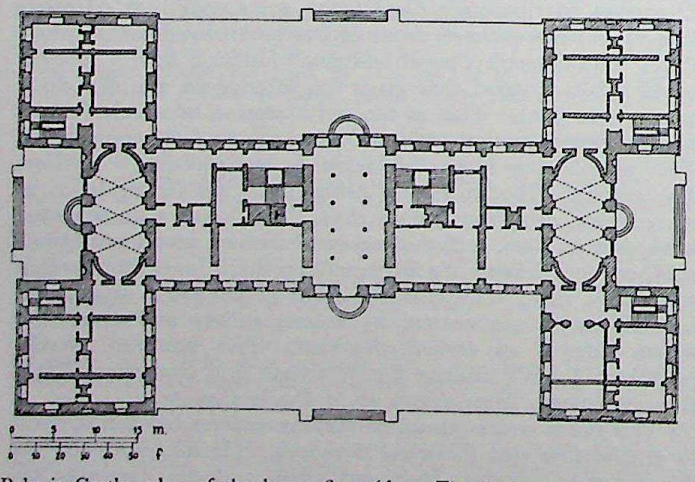
CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

the church is treated with a portico on two Tuscan columns *in antis*. The Tuscan order, as described by Vitruvius, and the Tuscan motif are employed with consistency throughout.

After the design of the Queen's Chapel at Marlborough Gate and the Vitruvian exercise at Covent Garden, the most interesting evidence of Jones's preoccupation with the antique is a series of drawings, executed for the most part by Jones's pupil John Webb, for a complete reconstruction of Whitehall Palace (FIG. 926). In these studies there is a marked attempt to achieve an antique gravity of effect, above all to recapture the internal space forms of imperial Roman architecture. This element seems to be lost sight of in drawings that appear to be later versions of the reconstruction scheme, for they are more purely Italianate in the truest Renaissance sense. These later schemes seem to date, at least in part, from the period immediately preceding the English Civil Wars and are related to some elevations for the treatment of Somerset House.

In 1634 Jones was appointed architect for the restoration of St. Paul's Cathedral in London. The restoration of St. Paul's consisted of refacing the exterior of the transepts and nave and of building a colossal octastyle Corinthian portico across the west end. The portico was about 115 ft. long and projected 40 ft. from the west face of the building; the columns were 50 ft. high. The portico had no pediment and was finished with a balustrade, a treatment for which Jones found precedent in Palladio's illustration for the portico of the Temple of the Sun and Moon. The great surviving monument from the 1630s is the interior treatment of the Queen's House at Greenwich, work on which was resumed for Queen Henrietta Maria in 1629. These interiors, for which a number of drawings survive, as well as much of the work itself, are the best surviving examples of Jones's more intimate work for the royal family and the court. The interiors give some idea of the type of decoration used in his other royal works, notably at Somerset House.

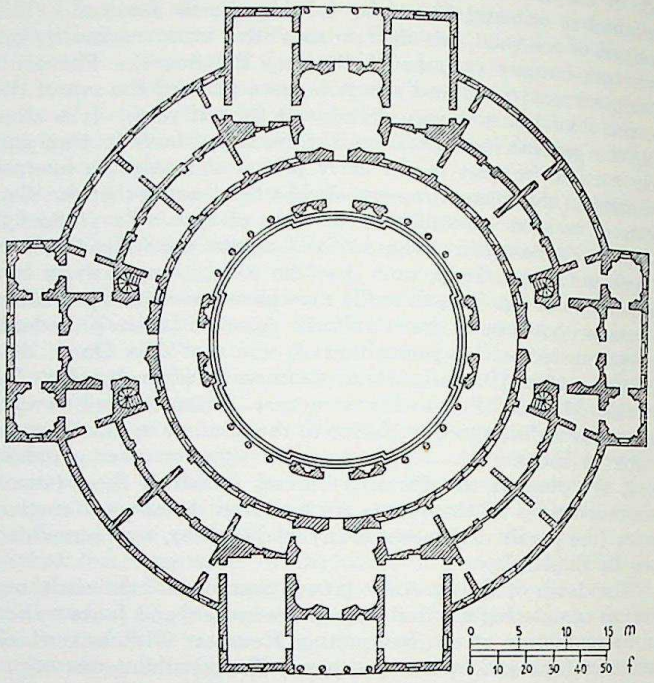
The 1630s was also a productive period in theatrical design. Designs exist for 14 important masques that were performed between 1631 and 1640 (PL. 342). In the earlier part of this period the differences between Jones and his great collaborator Ben Jonson reached a climax. The quarrel eventually attained the character of a public scandal, and Jonson ceased to be employed to write the masques at court. The quarrel was more than a mere clash of personalities and fundamentally reflected Jonson's refusal to accept the Italian ideas of Jones regarding the dignity of the visual arts as compared with literature.



Belvoir Castle, plan of the lower floor (*from The Designs of Inigo Jones, London 1727*).

Inigo Jones's work, both for the court entertainments and as Surveyor to the Crown, continued into the early 1640s. His last court masque, *Salamacida Spolia*, was produced in January, 1640, and in 1642 Jones left London, handing over his office to John Webb as deputy. Jones is lost to sight from that time until he was taken prisoner at the sack of Basing House in 1645.

In 1647 a fire at the Earl of Pembroke's house at Wilton, near Salisbury, provided the occasion of Jones's last important employment as an architect. This work consisted of the building and interior finishing of a range of state apartments fronting on the gardens (PL. 341). There is evidence that Jones's exterior may in some degree have been conditioned by an earlier scheme by the architect Isaac de Caux. Internally the work seems to



Design for a central-plan structure (*from The Designs of Inigo Jones, London, 1727*).

be entirely by Jones and Webb. These interiors comprise the great "Double" and "Single Cube Rooms," the former designed to contain a series of portraits by Van Dyck (PL. 341). The decorations are markedly French in character and are derived from Jean Barbet's *Livre d'Architecture* and Pierre Le Muet's *Traicté des cinq ordres d'Architecture*. Inigo Jones died the same year that Wilton House was finished.

The posthumous reputation of Inigo Jones reached its height in the period 1710–60. His drawings and buildings and those of John Webb were engraved and published, and Jones's name was associated by English critics with Rubens and Fiammingo (François Duquesnoy) as one of the three greatest northern Europeans to follow in the tradition of the Italian masters of the 16th century. Two contemporary portraits of Jones are known, a drawing by himself and the portrait by Van Dyck (Leningrad, The Hermitage).

JORDAENS, JACOB. Flemish painter of religious, mythological, and genre subjects (b. Antwerp, May 19, 1593; d. Antwerp, Oct. 18, 1678). Jordaens, the oldest of 11 children, was the son of a prosperous linen merchant. At an early age he was apprenticed to Adam van Noort, a painter who had also taught Rubens. In 1616 he married Van Noort's daughter Cath-

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

arina, by whom he had three children. The artist remained in close contact with his father-in-law, whose jovial face appears in many of his paintings. In 1641 he built for himself a palatial house, parts of which are still preserved in Antwerp (II, PL. 147). Jordaens appears to have embraced Calvinism soon thereafter; he was once fined for writing Calvinist pamphlets, but apparently he was not seriously molested for his heresy, and he in turn had no qualms about painting altarpieces for Catholic churches. Jordaens was buried in a Calvinist cemetery in Putte, a village near the Dutch border.

Jordaens's career was as uneventful as it was long. He traveled little and appears to have had none of the social ambitions of Rubens or Van Dyck. Only rarely was he charged with large decorative projects, the best known being two huge allegories glorifying Frederick Henry of Orange (1652), which are located in the royal villa of Huis ten Bosch outside The Hague. Most of his work was done for the *bourgeoisie* and for the churches and charitable institutions of Antwerp.

Although never a pupil of Rubens, from the beginning Jordaens showed the influence of that master; he must have been familiar also with the ideas of Caravaggio, yet Jordaens possessed a vigorous and highly personal idiom, characterized by an earthy optimism and frank sensuousness (V, PL. 298). His pictures often lack restraint and tend to be crowded, but they compensate for their faults in the glowing beauty of their colors and in the sheer animal strength and happiness of their figures. Jordaens revived some of the ideas of the elder Bruegel, translating them into the opulent language of the baroque; like Bruegel he used the wisdom of popular proverbs to point a moral, but he avoided the pessimism of the older artist. He borrowed many of his themes from the Dutch poet Jakob Cats, who himself was representative of a simple and somewhat shallow middle-class morality.

Jordaens's long career can be divided into several periods, but his art changed very gradually. His first period (ca. 1612–25) is the most interesting, owing to the forceful contrasts of light and shade and the unaffected simplicity of his types. Characteristic works of this period are two paintings, both titled *Adoration of the Shepherds* (Stockholm, Nationalmus.; Grenoble, Mus. de Peinture et Sculpture), *The Satyr and the Peasant* (Brussels, Mus. Royaux des B. A.; V, PL. 323), *Family Portrait* (Leningrad, The Hermitage), *The Artist's Family* (Madrid, Prado; II, PL. 206), and *The Ferryboat of Antwerp*, also called *The Tribute* (Copenhagen, Nationalmuseet). The paintings of his middle years (1625–50) are outstanding for coloristic subtlety and harmoniousness. Most of his pictures of happy family gatherings and of the *Adoration* belong to this period. During the 1640s Jordaens designed several series of tapestries which were woven in Brussels. After 1650 his art declined, and he repeated (not to their advantage) many of his earlier designs. Jordaens was one of the most prolific draftsmen of his age. He preferred pen and ink in his earlier years, black and red chalk later on. His Calvinist leanings show most clearly in the subjects of his later drawings. He also made a small number of etchings.

Julius S. HELD

JORDAN. State of the Near East, established in 1950 (formerly Transjordan) as the Hashemite Kingdom of Jordan. It is bordered on the west by Israel, on the north by Syria, on the east by Iraq, and on the southeast by Saudi Arabia.

SUMMARY. Historical-artistic background (col. 929). Western Jordan (col. 932). Eastern Jordan (col. 938).

HISTORICAL-ARTISTIC BACKGROUND. The historical and artistic development of Jordan is closely connected to that of Israel (q.v.); in fact, the two states divide, by an extremely irregular border, the Palestine geographical area, which is relatively homogeneous in its nature and in its history. Archaeological discoveries have established that human beings inhabited western Jordan, specifically the caves of the desert of Judah, as far back as the Mesolithic period, and that their culture was well developed, as indicated by the different types of grain found. Western Jordan was also the site of the oldest urban culture yet known, that of Jericho, whose origins go back to the first half of the 8th millennium B.C. Even in this period the city was fortified by a circle of defensive walls, and by a sturdy stone tower equipped with stairs inside and with an underground passageway. To the Neolithic period (6000–4000 B.C.) belong the first works of sculpture: a mask of painted terra cotta and a series of human skulls, covered with clay and with traces of paint (IX, PL. 414). In the Chalcolithic period (4000–3000 B.C.), the first earthenware products appear, together with crude statuettes of animals. Particularly interesting, because of its age, is a pictorial composition, discovered at Teleilat Ghassul, showing a large multicolored star and remains of human figures, animals, and demons. The lifelike figure of a bird is especially striking.

In the Bronze Age (3000–1200 B.C.) western Jordan was in the cultural sphere of the Palestine region and thus under the prevailing Egyptian influence, while in the eastern part, inhabited by seminomadic peoples, there appeared numerous megalithic monuments. The quality of clay statuettes does not exceed the average level for objects of this nature, the more advanced techniques of neolithic Jericho having been forgotten by this time, whereas the toreutics and ivory carving reveal marked technical skill (assuming that the objects found in Jordan were locally produced and not imported); examples are a cow's head in ivory from Jericho, in a markedly Geometric style, and a statuette of silver-plated bronze from Tell el-Far'ah representing a female divinity in a notably realistic manner. The pottery making of the 2d millennium represents a local variation of the Syrian school known as "Mitannian," which is characterized by geometric designs, figures of animals — especially birds — and stylized trees; the Mycenaean influence on these works is readily seen. The theriomorphic and anthropomorphic vases belong to the same cultural climate.

In the Iron Age, corresponding to the period of Hebrew political domination (see JEWISH ART), the production of crude religious statuettes, mostly of women, continued; recent discoveries at Amman point to the existence of a local school of sculpture which was characterized by reduced dimensions of the human figure, the relief on a stele found at Balu'ah being stylistically quite different. Notable in the field of minor arts is the series of ivories found in Samaria (PL. 332); their style links them to those of the Phoenicians found in various parts of Palestine, Syria, and Mesopotamia. In architecture use is made, as in Israel, of the proto-Aeolic capital, an archi-

tectural adaptation of a decorative motif, the palmette. The defensive walls of Samaria, distinguished by their strong towers with round bases, date from the period of Persian and Greek domination, as does the castle of the Tobiads at ʿArāq el-Emīr, adorned by a frieze of lions. In this period and in the following ones, there is a strong Greek influence on the country, especially in the arts; naturally, however, the works are still markedly provincial in character, and utilize local iconographic and stylistic themes. Thus, while the influence of the city-planning theories of Hippodamos of Miletos is seen in the large cities of the Roman era, in other sites, such as Petra, far from the urban centers and in the midst of the rocks, another style — theatrical, imposing, and completely alien to the Greek concept — is revealed; the latter trend is also present, to a lesser degree, in the tombs of Jerusalem. Stylistically more independent are the Nabataean works found in neighboring areas, such as the statues of the temple at Khirbat el-Tannūr, which seem to foreshadow Byzantine features. Nabataean pottery is notable for the refinement of its decoration, characterized by graceful plant motifs. The imprint of Byzantine rule is seen throughout Jordan; in addition to several basilicas, there are numerous fortresses along the edge of the desert.

A new artistic flowering took place in Jordan in the Arabic period immediately following the conquest (637 A.D.); there appeared in the desert new fortresses and rich buildings often decorated with stuccowork and mosaics, a striking example being the great palace at Khirbat al-Mafjar, which also included a mosque (see OMMIAD SCHOOLS). The arrival of the Crusaders (1099–1250) brought to Jordan the influence of the religious and military architecture of Europe, as well as construction techniques which endure to this day.

Elements of the Ottoman tradition, introduced by the Turkish occupation at the beginning of the 16th century, spread throughout the land in the four centuries that followed, during which time the territory of Jordan was a part of the Ottoman Empire. However, the monuments of this period, some of which reveal an Ottoman-baroque style, are rare and poorly preserved. On the other hand, both religious and civil building flourished during the 19th century, leaving a definite stamp on the towns of Jordan. There was a marked development of civil buildings, such as asylums, colleges, centers of the foreign colonies, schools, and private houses.

In the early 20th century, tastes with regard to the building of churches, monasteries, and seminaries became noticeably eclectic. A further step forward in building took place in 1920, when the Transjordan districts of ʿAjlun, Belqa, and el-Kerak formed an emirate, to which Maʿan and ʿAqaba were annexed in 1925 under the British mandate. In this period there prevailed an eclectic tendency toward an imitation of the classical European styles fused with elements of the local tradition. In more recent times, after the country's many vicissitudes as well as the Arab-Jewish conflict, there has been a great renewal of construction throughout the country, following the latest international trends but retaining elements of the local tradition, especially in ornamentation. All city-planning schemes follow modern Westernized criteria. There are numerous hotels and housing units, such as the Dead Sea Hotel (1959) on the Dead Sea and the facilities of such health resorts as Ramallah and Beit Jala. There are port facilities in ʿAqaba.

WESTERN JORDAN. The description of places of interest proceeds from west to east, and from north to south.

Silet ed-Dahr. A burial cave, enlarged in the Roman period, it contained a great number of Roman and Byzantine earthenware oil lamps, and a bust in Oriental style.

Bibliog. O. R. Sellers and D. C. Baramki, A Roman-Byzantine Burial Cave in Northern Palestine (BAmSOR, Sup. Studies, 15–16), New Haven, Conn., 1953.

Samaria (Shomeron, Σαμάρεια, Σεβαστή, Sebastye). Former capital of the kingdom of Israel, founded by Omri, it underwent a radical transformation at the hands of Herod the Great; in the Roman period, and especially between A.D. 180 and 230, it covered a considerable expanse, as a result of the large buildings erected at that time. Archaeological campaigns have brought to light the remains of the palace structures of Omri and of Ahab on the acropolis, with their distinctive proto-Aeolic capitals placed on pilasters set against the sides of the enclosure walls and the sides of a gate. Belonging to the same Israelite period are numerous ivory plaques in pseudo-Egyptian style, and the inscriptions on vases regarding the wine and oil industries. The citadel and the circular towers belong to the Hellenistic era. Of the constructions of Herod, there are: the remains of the great temple dedicated to Augustus (Gr., Sebastos), in whose honor the city assumed the name of Sebaste; ruins of another temple which was dedicated to Kore; as well as the remains of a stadium later reconstructed with large colonnades. To the period of the city's prosperity in the 2d and 3d centuries belong a basilica, the great

933

Tell el-Far'ah (Tirzah). A locality inhabited from the chalcolithic era until about 600 B.C., with an interruption from approximately 2500 to about 1900 B.C. The first walls were erected about 2800 B.C.; a building with a colonnade belongs to the middle of the 2d millennium; there are numerous houses from the Israelite period. Cult statues of terra cotta have been found in the neighborhood, as has a small statue in silver-plated bronze, perhaps representing the goddess Hathor.

Bibliog. R. de Vaux, [Les fouilles à Tell el-Far'ah, près Naplouse], RBib, LIV, 1947, pp. 394–433, 573–89, LV, 1948, pp. 544–80, LVI, 1949, pp. 102–38, LVII, 1951, pp. 393–430, 566–90, LIX, 1952, pp. 551–83, LXIV, 1957, pp. 552–80; R. de Vaux, The Excavations at Tell el-Far'ah and the Site of Ancient Tirzah, PEQ, LXXXVIII, 1956, pp. 125–40.

Nablus (Flavia Neapolis). City founded by Titus in A.D. 72 of which there remain some underground Jewish tombs and the ruins of a Roman villa.

Bibliog. L. H. Vincent, Un hypogée antique à Naplouse, RBib, XXIX, 1920, pp. 126–35; F. M. Abel, Naplouse: Essai de topographie, RBib, XXXII, 1923, pp. 120–32.

Mount Garizim (Gerizim). Formerly a renowned shrine of the kingdom of Israel, believed to be the location of Abraham's sacrifice and an altar built by Joshua; today there remains only the massive rectangular enclosure wall, in rusticated ashlar, which surrounds the octagonal basilica erected by the emperor Zeno in 484. This is flanked by four small chapels, one of which, with a hexagonal font, served as a baptistery.

Bibliog. A. M. Schneider, Garizim, Z. des D. Palästina-Vereins, LXVIII, 1951, pp. 211–34.

Sichem (Shechem, Σίχιμα, Balata). Continuous excavations conducted in the city have revealed the cyclopean walls of the middle Bronze Age and the great expansion in construction that took place in the late Bronze Age. To the latter period belong two monumental gates, destroyed by the Egyptians in the 16th century B.C. In addition to the scanty remains of the Israelite and Hellenistic periods, mention must be made of the so-called "Well of Jacob" with the ruins of the two churches that were later constructed on top of it.

Bibliog. E. Sellin, Die Ausgrabung von Sichem, Z. des D. Palästina-Vereins, XL, 1926, pp. 229–36, 304–20, L, 1927, pp. 205–11, 265–74; F. M. T. Böhl, De Opgraving van Sichem, Zeist, 1927; G. Welter, Stand der Ausgrabungen in Sichen, AAnz, 1932, cols. 289–316; F. M. Abel, Le puits de Jacob et l'église Saint-Sauveur, RBib, XLII, 1933, pp. 384–402; G. E. Wright, The First Campaign at Tell Balâṭah (Shechem), BAmSOR, 144, 1956, pp. 9–20, The Second Campaign at Tell Balâṭah (Shechem), BAmSOR, 148, 1957, pp. 11–28; L. H. Vincent, Puits de Jacob ou de la Samaritaine, RBib, LXV, 1958, pp. 547–67.

Shiloh (Σηλώ, Seilun). On this site Israelite and Roman walls are preserved, as well as the remains of houses of the Bronze Age and the Israelite period. There are also two churches (5th–6th cent.), in one of which is a mosaic composition of two facing animals separated by a plant. Coming from nearby Turmus 'Aya is a Roman sarcophagus with representations of Dionysus, the seasons, the earth, and the ocean.

Bibliog. R. Savignac and E. Michon, Découverts à Tourmous 'Aya, RBib, X, 1913, pp. 106–18; H. Kjaer, The Excavation of Shiloh 1929, Palestine O. Soc. J., X, 1930, pp. 87–174.

Bethel (Beitin). On this site, inhabited from the early Bronze Age, there remain ruins of the walls and of a fortress of the Hyksos period, as well as traces of Roman and Byzantine buildings; a mosque rises over the ruins of a Byzantine church.

Bibliog. W. F. Albright, The Kyle Memorial Excavations at Bethel, BAmSOR, 56, 1934, pp. 2–15, 57, 1935, pp. 27–30; J. L. Kelso, The Second Campaign at Bethel, BAmSOR, 137, 1955, pp. 5–10, The Third Campaign at Bethel, BAmSOR, 151, 1958, pp. 3–8.

Tell en-Nasbeh (Mizpah). Of this city there remain parts of the walls of various periods (from the early Bronze Age to the Israelite period), many houses from Israelite times, and the remains of a temple dedicated to Astarte.

Bibliog. C. C. McCown and J. C. Wampler, eds., Tell en-Naṣbeh..., (2) vols., Berkeley, Calif., 1947 ff.

'Amwas (Νικόπολις, Nicopolis, Emmaus of the Maccabees). Found here is an imposing ruin with three apses, of large dressed stones, thought to be the remains of a church dating from the 2d–4th century. The mosaic pavement has scenes with animals against a background of papyrus plants. In the 12th century a church was built against the three apses; part of it is still preserved.

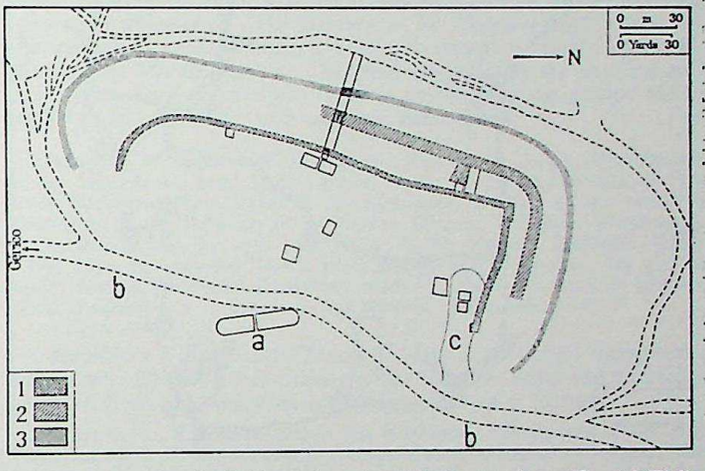
Bibliog. J. Lassus, Sanctuaires chrétiens de Syrie, Paris, 1932, pp. 80–87; L. H. Vincent and F. M. Abel, Emmaüs, sa basilique et son histoire, Paris, 1932; C. Cecchelli, Il problema della basilica cristiana precostantiniana, Palladio, VII, 1943, pp. 1–13.

Ramallah. A small city of recent origin, which became a well-known and well-equipped health resort after the Arab-Jewish conflict (1949). The city is laid out in modern fashion, with wide streets, houses, hotels, and office buildings which reflect international influences.

el-Qubeibeh (according to later tradition, the Emmaus of the Gospels). Here are preserved the remains of a village dating from the period of the Crusades, with a wide artery lined with shops, a church with nave and side aisles, and a castle. The church and the monastery of the Franciscans are of the early 20th century.

Bibliog. B. Begatti, I monumenti di Emmaus el-Qubeibeh e dei dintorni, Jerusalem, 1947.

Jericho (Eriha, Ἱεριχώ). This city was founded during the Mesolithic period, and by the Neolithic period had acquired walls and a tower (a neolithic dwelling is illustrated in IX, PL. 413). Some



Jericho, plan of the city in the early and middle Bronze Age. *Key*: (1) Walls of the city of the early Bronze Age; (2) embankment from the middle Bronze Age; (3) ditch from the middle Bronze Age. (*a*) Reservoir; (*b*) modern street; (*c*) area excavated by Garstang [*from A. D. Tushingham, The Joint Excavations at Tell el-Sultan (Jericho), BAmSOR, 127, 1952*].

tombs which have yielded rich archaeological finds date back to the Bronze Age, as do the mighty encircling walls. After violent destruction in the 16th century B.C., there were minor settlements on the tell until the city rose again, through the efforts of Herod, near the Qilt River. Belonging to the Roman period are remains of a palace with large niches for statues, in *opus reticulatum*, the only one of its kind in Jordan. There are some mosaics from the Christian period. A little to the north lie the imposing ruins of Khirbat al-Mafjar (see OMMIAD SCHOOLS). This is a large palace with a rectangular ground plan, with an adjacent mosque and bathhouse, as well as a courtyard in front with a basin and a pavilion, the whole complex encircled by a large wall. Both the palace and bathhouse were richly decorated with paintings, sculptures, and mosaics, many of which have survived to this day, in varying states of preservation. Among the most sensational discoveries are some stucco figures in full relief, which represent an eminent personage or ruler (X, PL. 382), dancing girls, and horsemen, and rich relief decorations in gesso, stucco, and stone. Less original, but no less admirable, is the mosaic part of the bath and of the palace, with iconographic and decorative motifs in Hellenistic-Oriental style (X, PL. 383). Khirbat al-Mafjar dates from the time of the Ommiad caliph Hishām (724–43). Nearby is the 19th-century Monastery of the Forty Days (or Sarandarion).

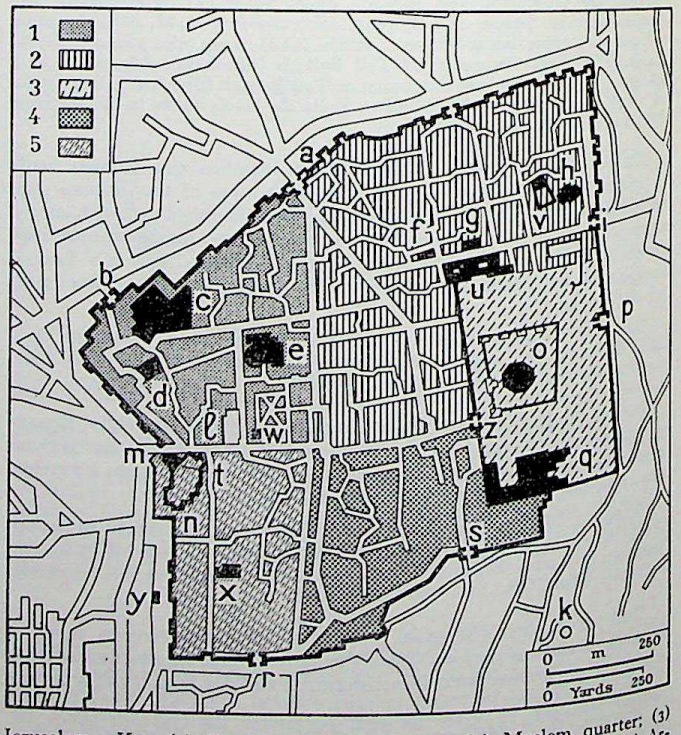
Jerusalem, general plan of the archaeological remains. *Key*: (1) Modern walls. Monuments: (*a*) First wall, from the period of Solomon; (*b*) second wall, from the period of Hezekiah (?); (*c*) third wall, from the period of Herod Agrippa; (*d*) fourth wall, from the period of Aelia Capitolina; (*e*) area of the Temple; (*f*) remains of the Antonia Fortress; (*g*) aqueduct of Hezekiah; (*h*) steps of the City of David; (*i*) Ophel; (*j*) citadel and Tower of David.

Jerusalem (Urusalim, Hierosolyma, Aelia Capitolina, el-Quds). The boundary established by the armistice in 1949 divided the city into two parts; Jordan has retained almost all of the more ancient part of the city, surrounded by medieval walls, while Mount Zion was assigned to Israel (q.v.). On the Mount of Olives there is a tomb dating from the end of the 2d millennium. The Temple and the Palace of Solomon having disappeared, all that remains from the period of the Monarchy is the underground aqueduct of Hezekiah (FIG. 935). A considerable amount remains of the temple which was reconstructed by Herod in place of the one destroyed by Pompey in 63 B.C., including the great walls of the open space between the city and the citadel, and the huge entrances with their domed gates. Dating from the same period are the ruins of the Antonia Fortress and the base of the Tower of David; parts of the Hasmonean walls have also been preserved. Also belonging to the Hellenistic-Roman period are some huge tombs dug out of the rock on the outskirts of the city, among them: the tomb of Herod's family and tombs of the kings of Adiabene ("Tombs of the Kings"), which consist of a courtyard with an atrium leading to the burial chambers, and the tombs situated in the Valley of the Kidron — the Tomb of the Beni Hezir (so-called "Tomb of St. James"), with a façade in Doric style and once having had a pyramidal roof, now missing (PL. 331); the so-called "Tomb of Zechariah," a monolithic construction in Egyptianizing style with Ionic columns on the outside; and finally the so-called "Tomb of Absalom" (PL. 331) and "Tomb of Jehoshaphat." Of the Aelia Capitolina reconstructed by Hadrian, there remains only the outline, still followed in the Old City, and a triumphal arch called the Ecce Homo Arch.

Among the few remaining churches of the many built during the period from the time of Constantine to that of Justinian are the Church of the Tomb of the Virgin, which was extensively restored by Crusaders, and the Church of St. John the Baptist, both dating from the 5th century. In addition, many mosaic pavements have been preserved. Dating from the early Islamic period is the Mosque of 'Omar, called the Dome of the Rock (Qubbat al-Sakhrā), built on the site of the Temple of Solomon. Completed in 691 under the caliph 'Abd al-Malik, this octagonal building is both one of the most venerated Islamic shrines and one of the most notable monuments of Moslem architecture (PL. 146). The exterior, formerly embellished with mosaics, is now covered by a ceramic decoration dating from the era of the Ottoman sultan Sulaymān (16th cent.). The interior, to which four doors at the cardinal points give access, is comprised of two concentric ambulatories and a center room that contains the rock which, according to Islamic belief, was the starting point of Mohammed's miraculous voyage to heaven. Above this central area is a two-story drum, covered with 11th-century mosaics, and on top of this is a dome which was restored and paneled with wood in the late 19th century. On the inner arches of the eight walls are some very precious mosaics — representing date palms, rinceaux, and garlands — that date from the end of the 7th century, the period of the foundation itself, although the dedicatory inscription in Kufic characters bears the name of the 9th-century caliph, al-Ma'mūn. (See X, PLS. 182, 377, 385.) Some of the handsome stained-glass windows also date from the time of the sultan Sulaymān. In 1960, sheets of gilded aluminum were placed on the roof of the monument.

The period of the Crusades has left several churches — such as the Church of the Holy Sepulcher (restored in 1810), the Church of St. Anne, and the Church of the Ascension — as well as traces of Latin taste in later mosques, such as the Aqsā Mosque. Built by the Moslems during the Ommiad age, and continued during the Abbasside age, the Aqsā Mosque has undergone, over the centuries, a series of remodelings and modifications (colonnade and ceiling restored, 1939), which makes it almost impossible to reconstruct its original appearance. It now consists of seven pillared aisles with a rich mihrab from the era of Ṣalāh ad-Dīn and a mimbar which Nūr ad-Dīn had built as a votive offering for the reconquest of Jerusalem by the Moslems. The region was the capital of the Latin kings of Jerusalem, and, from 1128, the seat of the Order of Templars.

Dating from the 15th century are the Qāit Bey Fountain (1482) and the portal of the Ashrafiya Madrasah. Occupied by the Turks in 1517, the city remained under Ottoman rule for four centuries. It flourished in the 16th century under Sulaymān the Magnificent; notable constructions of this era, especially remarkable for the materials utilized, are the fountain of the Bāb el-Silsileh (1537) and the fortifications of the citadel with the Damascus Gate (1532). Following



Jerusalem. *Key*: (1) Greek and Latin quarter; (2) Moslem quarter; (3) Haram el-Sherīf (area of the Temple); (4) former Hebrew quarter; (5) Armenian quarter. this period there was a gradual decline. In the Ottoman period, the Church of St. James was restored and enlarged (the portico dating from 1712), as was the Dome of the Rock (the east portico dating from 1780), and the Coptic monastery was built.

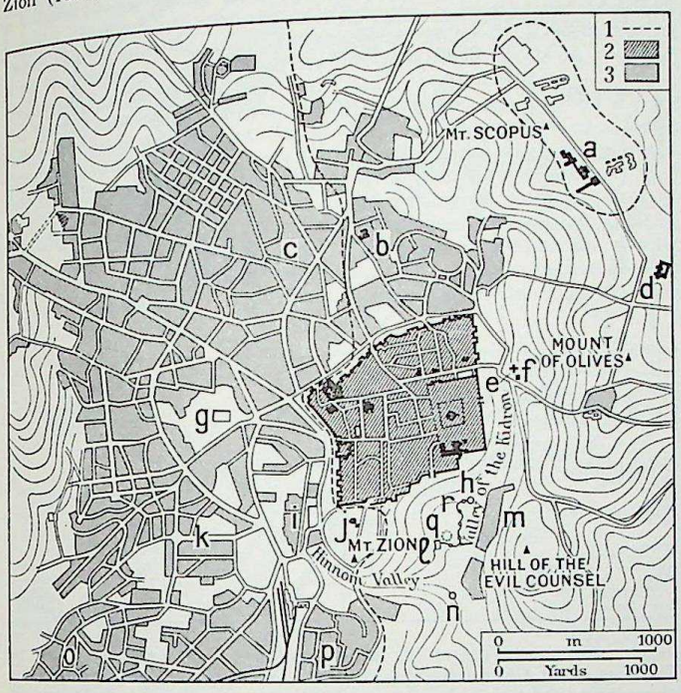
With the 19th century there was a significant increase in construction, and, in addition to important restorations of many monuments, new religious buildings were constructed, such as the German Lutheran Church of the Saviour (1898; built over the old Church of St. Mary the Latin, 10th–11th cent.), the Church of the Sisters of Zion (1868; architects, Daumiet and Mauss), the Church of the



Jerusalem, development of the city in its topographic setting. *Key*: (1) Modern national boundary between Jordan and Israel; (2) the old city within the walls; (3) extent of the present inhabited district. Principal monuments and buildings: (*a*) Hebrew University; (*b*) "Tombs of Kings"; (*c*) Mandelbaum Gate; (*d*) Church of the Ascension; (*e*) Church of the Tomb of the Virgin; (*f*) Gethsemane; (*g*) Birket Mamilla; (*h*) Gihon; (*i*) Birket el-Sulṭān; (*j*) "Tomb of David" and the Cenacle; (*k*) Talbieh; (*l*) Pool of Siloam; (*m*) village of Silwan; (*n*) ʿain Rogel; (*o*) Katamon; (*p*) Abū-Tor; (*q*) royal tombs; (*r*) aqueduct of Hezekiah.

Pater Noster (1875), the Chapel of the Holy Sepulcher, as well as the Alexandra hospice of the Russian Orthodox community, the hospice of the Johannites (1855), the German Catholic hospice of St. Paul, the headquarters of the Dominican Colony (1881), and the el-Maʿmūniya College (1892; built over the old Church of St. Magdalene of the Jacobites). Dating from the early part of the 20th century are the Basilica of St. Stephen (ca. 1900; built over the 5th-cent. original), the Palestine Archeological Museum (1927), the Greek Catholic Seminary of St. Anne, the Oratory of the Chapel of Golgotha (1937), and the Roman Catholic Church of All Nations (1924). Other museums are the Archaeological Museum of the Studium Biblicum Franciscanum and the Museum of the White Fathers.

Bethany (Βηθανία, el-ʿAzariya). Preserved here are the ruins of a church built in the 4th century near the traditional tomb of Lazarus, of a later church built on the same spot, and of the abbey built by Queen Melisande in the 12th century.

Bibliog. S. J. Saller, Excavations at Bethany (1949–1953) (Studium Biblicum Franciscanum, Pubs., 12), Jerusalem, 1957.

Qumran. A region which has become famous since the finding of the Dead Sea Scrolls; it contains the ruins of an Essene "monastery" (ca. 100 B.C.–ca. A.D. 66), a settlement established for communal activities — such as eating, praying, and studying — by a religious sect who lived in nearby tents and caves. The complex includes conference rooms, a flour mill, a pottery, a scriptorium, and a two-story tower, as well as a network of canals and water tanks.

Bibliog. R. de Vaux, Fouilles au Khirbet Qumrān, RBib, LX, 1953, pp. 340–61, LXI, 1954, pp. 206–36, LXIII, 1956, pp. 533–77.

Bethlehem (Bēt Lehem, Beit Lahm, Βηθλεέμ). Preserved here in fairly good state is a rare church specimen: the Church of the Nativity, with five aisles and a triconch at its eastern end, built by Justinian over a Constantinian church, of which only parts of mosaics remain. A number of mosaic fragments have survived from additions made to the church by the Crusaders in the 12th century. The church was restored in 1671 and again in 1842. Nearby, at Bīr el-Qūtt and Khirbat Siyār el-Ghanam, two monasteries dating back to the period between the 5th and 7th centuries have been uncovered, yielding mosaic floors and liturgical objects. Also nearby is the Monastery of St. Sabas (5th cent.), which was destroyed by an earthquake and reconstructed in 1834. The Basilica of St. Theodore (5th cent.; reconstructed in 1952) is at Deir Dosi. In complete decline throughout the late Middle Ages and the first centuries of the modern era, the city has been given a new impetus by the religious groups which settled there during the 19th and 20th centuries.

Bibliog. W. Harvey, W. R. Lethaby, and O. M. Dalton, The Church of the Nativity at Bethlehem, London, 1910; L. H. Vincent and F. M. Abel, Bethléem, Paris, 1914; E. T. Richmond, Basilica of the Nativity: Discovery of the Remains of an Earlier Church, Palestine, Department of Antiquities, Q., V, 1936, pp. 75–81; L. H. Vincent, Bethléem, RBib, XLV, 1936, pp. 544–74, XLVI, 1937, pp. 93–121; B. Bagatti, Gli antichi edifici sacri di Betlemme, Jerusalem, 1952; V. Corbo, Gli scavi di Khirbat Siyar el-Ghanam e i monasteri dei dintorni, Jerusalem, 1955.

Herodium (Ἡρῳδίων). Tomb of Herod the Great, rising forth from a hill. The wall that circles the top has three apses and a circular room with an unusual plan resembling that of a fortress.

Bibliog. C. R. Conder and H. H. Kitchener, The Survey of Western Palestine, ed. E. H. Palmer and W. Besant (Palestine Exploration Fund, The Survey of Western Palestine), III, London, 1883, pp. 330–32.

Umm el-Zuweitina. Site of a prehistoric settlement; excavations have uncovered, among other things, a statuette of gray stone from the Natufian culture depicting a ruminant.

Bibliog. R. Neuville, Le paléolithique et le mésolithique du désert de Judée, Paris, 1951, p. 124.

Hebron (Χεβρών, Kiryat Arba, el-Khalīl). The colossal wall of rusticated ashlar which encloses the tombs of the patriarchs was the work of Herod the Great, who also constructed underground tombs next to the ancient ones, now inaccessible. More modest and less well preserved is the nearby wall of Ḥaram Rāmat el-Khalīl (Mambre), which commemorates Abraham's vision of the three angels. Constantine had constructed an undistinguished church there, the foundation of which still remains. The well, which was restored at that time, is still in use. Partly destroyed in the repression of the revolt against Ibrāhīm Pasha (1834), the city contains but a few vestiges of monuments of the modern age. Today it flourishes once again, expanding in the valley and along the eastern slopes of the hill.

Bibliog. L. H. Vincent, E. J. Mackay, and F. M. Abel, Le Haram el-Khalil, Paris, 1923; A. Dupont-Sommer, Les fouilles du Ramet-el-Khalil près d'Hébron, Syria, XI, 1930, pp. 16–32; E. Mader, Mambre, Freiburg im Breisgau, 1957.

ʿAin el-Maʿmūdiya. A spring near which was erected a little church dedicated to St. John the Baptist and used as a baptistery. Dating from the 6th century is a small fortification, now excavated, that safeguarded the church.

Bibliog. C. Kopp and A. M. Stève, Le désert de Saint-Jean près d'Hébron, RBib, LIII, 1946, pp. 547–75.

Eastern Jordan. Irbid. Traces remain of the walls of this city of the early Bronze Age — perhaps the ancient city of Arbila (Arbela); not until the Roman era was it inhabited again. The modern city has recently obliterated the remains of the Roman era.

Bibliog. G. L. Harding, The Antiquities of Jordan, London, 1959, pp. 54–56.

Marwa. On this site near Irbid, preserved in a Roman tomb, is a painting of mythological scenes.

Bibliog. C. C. McCown, A Painted Tomb at Marwa, Palestine, Department of Antiquities, Q., IX, 1942, pp. 3–10.

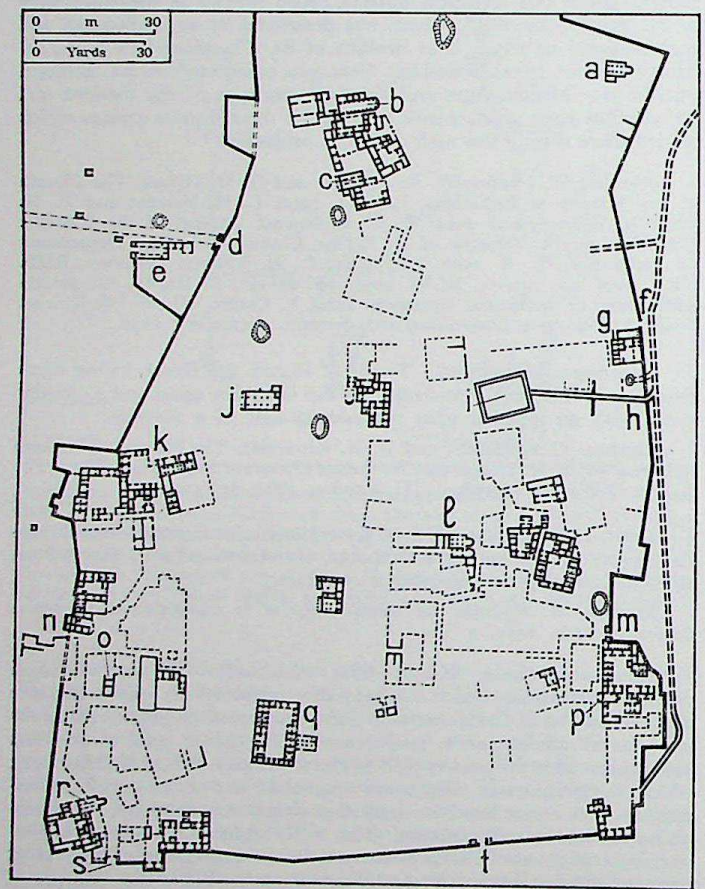
Pella (Πέλλα, Tabaqat al-Fahl). A city which was a refuge of Christians in the year A.D. 70, it contains the remains of a theater, the Temple of Zeus Areios, and a Christian basilica. It has not yet been excavated.

Bibliog. J. Richmond, Khirbet Fahil, Palestine Exploration Fund Q. Statement, 1934, pp. 18–31.

Zaharet el-Bedd. There is a Nabataean relief here depicting a serpent killing an eagle.

Bibliog. N. Glueck, Explorations in Eastern Palestine (Am. Schools of O. Research, Ann., XXV–XXVIII), IV, Part 1, Text, Philadelphia, 1951, pp. 202–03.

Umm el-Jemāl. City founded by the Nabataeans in the 1st century B.C., and very well preserved. Within its great Roman wall are a temple attributed to the Nabataean period, tombs, cisterns, and 15 Christian churches. The churches display two roofing techniques — one using transverse arches, the other utilizing columns to support a pitched roof. Two of the churches are dated: the Church of St. Julian (346) and the Cathedral (557). The Gate of Commodus and the *praetorium* remain from the Roman period.



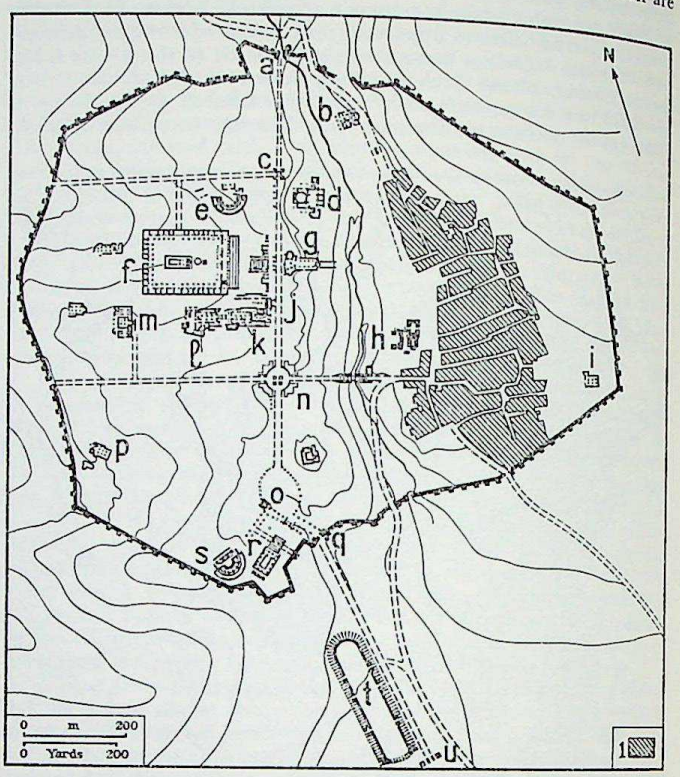
Umm el-Jemāl: (*a*) northeast church; (*b*) Church of St. Julian; (*c*) Church of St. Claudian; (*d*) Gate of Commodus; (*e*) west church; (*f*) northeast gate; (*g*) east church; (*h*) water gate; (*i*) Roman reservoir; (*j*) Cathedral; (*k*) *praetorium*; (*l*) double church; (*m*) east gate; (*n*) west gate; (*o*) Nabataean temple; (*p*) southeast church (*q*) barracks and tower; (*r*) southwest church; (*s*) southwest gate; (*t*) south gate (*from G. L. Harding, The Antiquities of Jordan, London, 1959, fig. 8*).

Bibliog. H. C. Butler, Architecture, Section A, Southern Syria (Syria: Pubs. of the Princeton Univ. Arch. Expeditions to Syria in 1904–5 and 1909, Division II), Leiden, 1919, pp. 149–213. G. L. Harding, The Antiquities of Jordan, London, 1959, pp. 146–50.

ʿAjlun. A medieval Arab castle called Qalʿat el-Rabadh is preserved here; constructed in 1184 and enlarged in 1214–15, it has towers, huge halls, and such sculptures as the stylized figures of birds in the entrance arch. In the surrounding territory there are Roman and Byzantine remains, including sarcophagi and mosaics. At Umm el-Manabya there are ruins of a small church with a Nilometer.

Bibliog. C. N. Johns, Medieval ʿAjlūn, Palestine, Department of Antiquities, Q., I, 1932, pp. 21–33; A. Augustinovič and B. Bagatti, Escursioni nei dintorni di ʿAğlūn, Studium Biblicum Franciscanum, Liber annus, 1952, pp. 227–314.

Jerash (Γέρασα, Gerasa). The best-preserved Roman city in the Near East. Everything is enclosed within Roman and Byzantine walls, except for the hippodrome and the triumphal arch, which are situated a little outside the south gate. It constitutes a typical example of a provincial Roman city; constructed around the *cardo* and two *decumani maximi*, and with two tetrapylons at their intersections, the city has a forum with a characteristically elliptical ground plan, a large temple dedicated to Artemis and another to Zeus, two theaters, and two thermae. The Roman remains date from the 2d and 3d centuries of the Christian Era, a period in which the city flourished economically. Especially significant among the 13 known churches are: the Cathedral, with its "miraculous fountain" in the courtyard; the Church of St. Theodore; the Church of St. John, with a central ground plan and with considerably advanced architectural motifs; and the Church of SS. Cosmas and Damian and that of St. George, with notable mosaics preserved *in situ*. The mosaics from the Church of St. John, finest of all because of their inventiveness and technique, have been in part transferred to the small local museum. A synagogue, some architectural traces of which remain, was transformed into a church in 531. Abandoned since 1131, Jerash was occupied at the end of the 19th century by a colony of Circassians, who built a village, using materials taken from the ancient city.



Jerash. *Key*: (1) Present-day inhabited sector. Principal buildings: (*a*) North gate; (*b*) Church of the Prophets, Apostles, and Martyrs; (*c*) north tetrapylon; (*d*) west baths; (*e*) north theater; (*f*) Temple of Artemis; (*g*) Viaduct church; (*h*) east baths; (*i*) Procopius Church; (*j*) nymphaeum; (*k*) Cathedral; (*l*) Church of St. Theodore; (*m*) Churches of SS. Cosmas and Damian, of St. John, and of St. George; (*n*) south tetrapylon; (*o*) forum; (*p*) Church of SS. Peter and Paul; (*q*) south gate; (*r*) Temple of Zeus; (*s*) south theater; (*t*) hippodrome; (*u*) triumphal arch (*from G. L. Harding, The Antiquities of Jordan, London, 1959, fig. 4*).

Bibliog. C. H. Kraeling, Gerasa, City of the Decapolis, New Haven, Conn., 1938; A. L. Detweiler, Some Early Jewish Architectural Vestiges from Jerash, BAmSOR, 87, 1942, pp. 10–17; J. H. Iliffe, Imperial Art in Trans-Jordan, Palestine, Department of Antiquities, Q., XI, 1945, pp. 1–26; G. L. Harding, Recent Work on the Jerash Forum, PEQ, 1949, pp. 12–20; S. J. Saller and B. Bagatti, The Town of Nebo, Jerusalem, 1949, pp. 269–89.

Qaṣr al-Hallābāt. In addition to Nabataean architectural remains, this site contains a Roman building dating from the time of Caracalla, which was later used as a monastery, and a 12th-century mosque; both structures are in ruins.

Bibliog. G. L. Harding, The Antiquities of Jordan, London, 1959, pp. 151–52.

Amman (Rabbath Ammon, Φλαδέλφεια, Philadelphia). The present-day capital of Jordan has yielded archaeological remains from

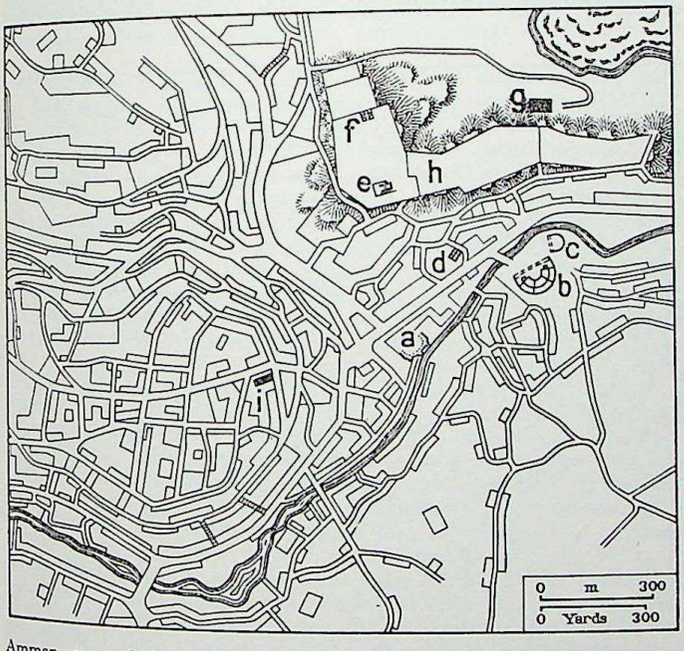
UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

941

as far back as Paleolithic times, but except for some tombs (such as that of Adoni Nūr with its interesting furnishings) from the middle of the 7th century B.C. and a few statuettes of the 1st millennium B.C., there are no monumental remains prior to the Roman period. On the west bank of the river there is a large triapsidal nymphaeum, from which a great deal of material has been taken and reused in modern constructions; there is a well-preserved theater, with an odeum nearby; part of the colonnade of the *cardo maximus* has also survived. The most important remains are on the citadel: parts of a wall of the 1st millennium B.C.; a Roman temple, dedicated to Hercules, containing a colossal statue of the god, fragments of which have been found; a small church of the 6th or 7th century; a rectangular building, called the "Tomb of Uriah," originally covered by a dome dating from the period A.D. 600–800, with the remains of reliefs on its walls; and, finally, a Byzantine gate.

Having declined in the earlier Middle Ages, it remained a poor village throughout most of the modern era. Ceded by the Turks to a colony of Circassians, it rose again, and material taken from Greco-Roman structures was used in the construction of its buildings. The capital of Transjordan since 1922, it has undergone a complete transformation, becoming the scene of an exceptional urban development, which was further increased after 1950, when it became the capital of the Hashemite Kingdom of Jordan. Of special interest are the palaces of Basman and Raghdan, dating from the end of the 19th



Amman, map of the city showing location of the remains of the ancient Philadelphia; (*a*) nymphaeum; (*b*) theater; (*c*) odeum; (*d*) propylaeum; (*e*) temple from the period of Marcus Aurelius; (*f*) "Tomb of Uriah" and temple area; (*g*) museum; (*h*) citadel; (*i*) el-Ḥusayn Mosque.

century. Of more recent date are the el-Ḥusayn Mosque (1924), the mausoleum of King ʿAbdullāh (1952), and many public improvements, as well as hotels and housing developments.

Bibliog. H. C. Butler, Architecture, Section A, Southern Syria (Syria: Pubs. of the Princeton Univ. Arch. Expeditions to Syria in 1904–5 and 1909, Division II), Leiden, 1919, pp. 34–62; R. ʿArāq el-Emīr. Preserved here are the ruins of a castle, variously dated from the 3d century B.C. to the 1st century of the Christian Era, that is associated with the name of the Tobiads. Its capitals, similar to those found in Petra, and a damaged frieze with lions in bas-relief are especially noteworthy.

Bibliog. H. C. Butler, Architecture, Section A, Southern Syria (Syria: Pubs. of the Princeton Univ. Arch. Expeditions to Syria in 1904–5 and 1909, Division II), Leiden, 1919, pp. 1–25; C. C. McCown, The ʿAraq el-Emir and the Tobiads, Bib. Archaeologist, XX, 1957, pp. 63–76.

el-Quweisme. A village near Amman, somewhat to the south, with a Roman mausoleum of cruciform plan; nearby is a mosaic depicting two churches, with an inscription stating that the priest T. Khobeos reconstructed the sacred edifice in 717–18.

Bibliog. R. E. Brünnow and A. Domaszewski, Die Provincia Arabia, II, Strasbourg, 1905, pp. 207–11; S. J. Saller and B. Bagatti, The Town of Nebo, Jerusalem, 1949, pp. 251–68.

Teleilat Ghassul. Excavations here have brought to light chalcolithic wall paintings (4th millennium B.C.). Despite their extremely poor state of preservation, it is possible to discern a complex composition, with human figures, animals, and demons. Superimposed layers of paintings testify to the existence of a fairly long-established school of painting.

Bibliog. A. Mallon, R. Köppel, and R. Neuville, Teleilat Ghassûl, I, Rome, 1934.

Mount Nebo. At the summit of nearby Ras Siyagha excavations have brought to light a triapsidal building and a large monastery. The structures date from the 2d and 3d centuries through the 7th. Notable are a mosaic of an imaginary temple of Jerusalem and the original capitals of a 5th-century church. Probings in the hill at Khirbat el-Mukhayyat have revealed remains dating from the Bronze Age to the 7th century of the Christian Era. The mosaics in the three churches are clearly visible and the one in the Church of SS. Lot and Procopius is especially interesting for its allegorical compositions (6th cent.).

Bagatti, The Town of Nebo, Jerusalem, 1949; H. Schneider, The Memorial of Moses on Mount Nebo, Jerusalem, 1950.

Quṣayr ʿAmra. A well-preserved castle, completed ca. 715 by the caliph al-Walīd I; it contains many frescoes (X, PL. 384), outstanding among them being portraits of such contemporary sovereigns as the emperor of Persia, the emperor of Byzantium, the Negus of Ethiopa, and the Visigoth Roderick.

Bibliog. A. Musil, Arabia Petraea, I, Moab, Vienna, 1907, pp. 275–85; K. A. C. Creswell, Early Muslim Architecture, I, Oxford, 1932.

Mshattā. The palace probably belongs to the Ommiad period. Never completed, it had a façade with luxurious decoration in bas-relief, most of which is now in Berlin (X, PL. 381). The central part of the vast building has a trefoil ground plan, with vaulted ceilings.

Bettini, Il castello di Mschâttâ: Transgiordania nell'ambito dell' "arte di potenza" tardoantica, in Anthemon: Scritti di archeologia e di antichità classica in onore di Carlo Anti, Florence, 1955, pp. 321–66; O. Grabar, Al-Mushatta, Baghdād, and Wāsiṭ, in J. Kritzeck and R. B. Winder, eds., The World of Islam (Studies in Honor of P. K. Hitti), London, New York, 1959, pp. 99–108; L. Trümpelmann, Mschatta: Ein Beitrag zur Bestimmung des Kunstkreises, zur Datierung und zum Stil der Ornamentik, Tübingen, 1962.

Qaṣr al-Kharāna. An imposing Ommiad defensive construction, with a Kufic inscription dating it 711, built on Hellenistic-Roman ruins. The two-story building has an almost perfectly square ground plan, and semicircular bastions along the perimeter. The rooms, which open off the sides of a large central hall, have vaulted ceilings.

Bibliog. G. L. Harding, The Antiquities of Jordan, London, 1959, pp. 157–59.

Madaba (Μαίδαβα, Μήδαβα). Repopulated in the 19th century, the city has not been excavated, but a tomb — with vases, bracelets, rings, arms, and scarabs — has been found here dating from the beginning of the 1st millennium B.C., as well as various Roman and Byzantine remains. The latter consist primarily of mosaic floors from churches of the second half of the 6th century that have been partly uncovered, with hunting and farming scenes, figures of bacchantes, and depictions of the myth of Achilles. Exceptionally interesting is the mosaic map of Palestine (III, PL. 494), still preserved in the Greek Orthodox church reconstructed in 1880 over the previous Early Christian building.

Palestine Exploration Fund, VI, 1953, pp. 27–33; M. Avi-Yonah, The Madaba Mosaic Map, Jerusalem, 1954.

Ma'in (Baal Meon). A mosaic, originally in a church, has been found here, with depictions of ecclesiastical structures representing various cities of Palestine and an allegorical composition.

Bibliog. R. de Vaux, Une mosaïque byzantine à Ma'in (Transjordanie), RBib, XLVII, 1938, pp. 227–58.

Diban (Dibon). Inhabited since the 3d millennium B.C., it was the capital of the kingdom of Moab. In 1868 the famous stele (ca. 830 B.C.) of King Mesha, who rebuilt the city, was found; it is now in the Louvre. Recent excavations have brought to light remains of walls of various periods, with a huge gate which was used from 3000 to 500 B.C., several tombs and a temple of the Moabitic period, Nabataean structures, a Roman *caldarium* and two Byzantine churches.

Bibliog. D. Mackenzie, Dibon: The City of King Mesa and of the Moabite Stone, Palestine Exploration Fund Q. Statement, XLV, 1913, pp. 57–79; S. J. Saller, Un'antica chiesa a Diban, RACr, XV, 1938, pp. 160–61; F. V. Winnett, Excavations at Dibon in Moab, 1950–51, BAmSOR, 125, 1952, pp. 7–20; A. D. Tushingham, Excavations at Dibon in Moab, 1952–53, BAmSOR, 133, 1954, pp. 6–26.

Umm el-Raṣāṣ. Numerous ruins, including those of churches, are enclosed within a surrounding wall; outside the wall, toward the north, there are fragments of architectural decorations with geometric motifs. A tower, elegant in form and of careful workmanship, situated so as to defend the reservoir, is well preserved.

Bibliog. S. J. Saller and B. Bagatti, The Town of Nebo, Jerusalem, 1949, pp. 245–51.

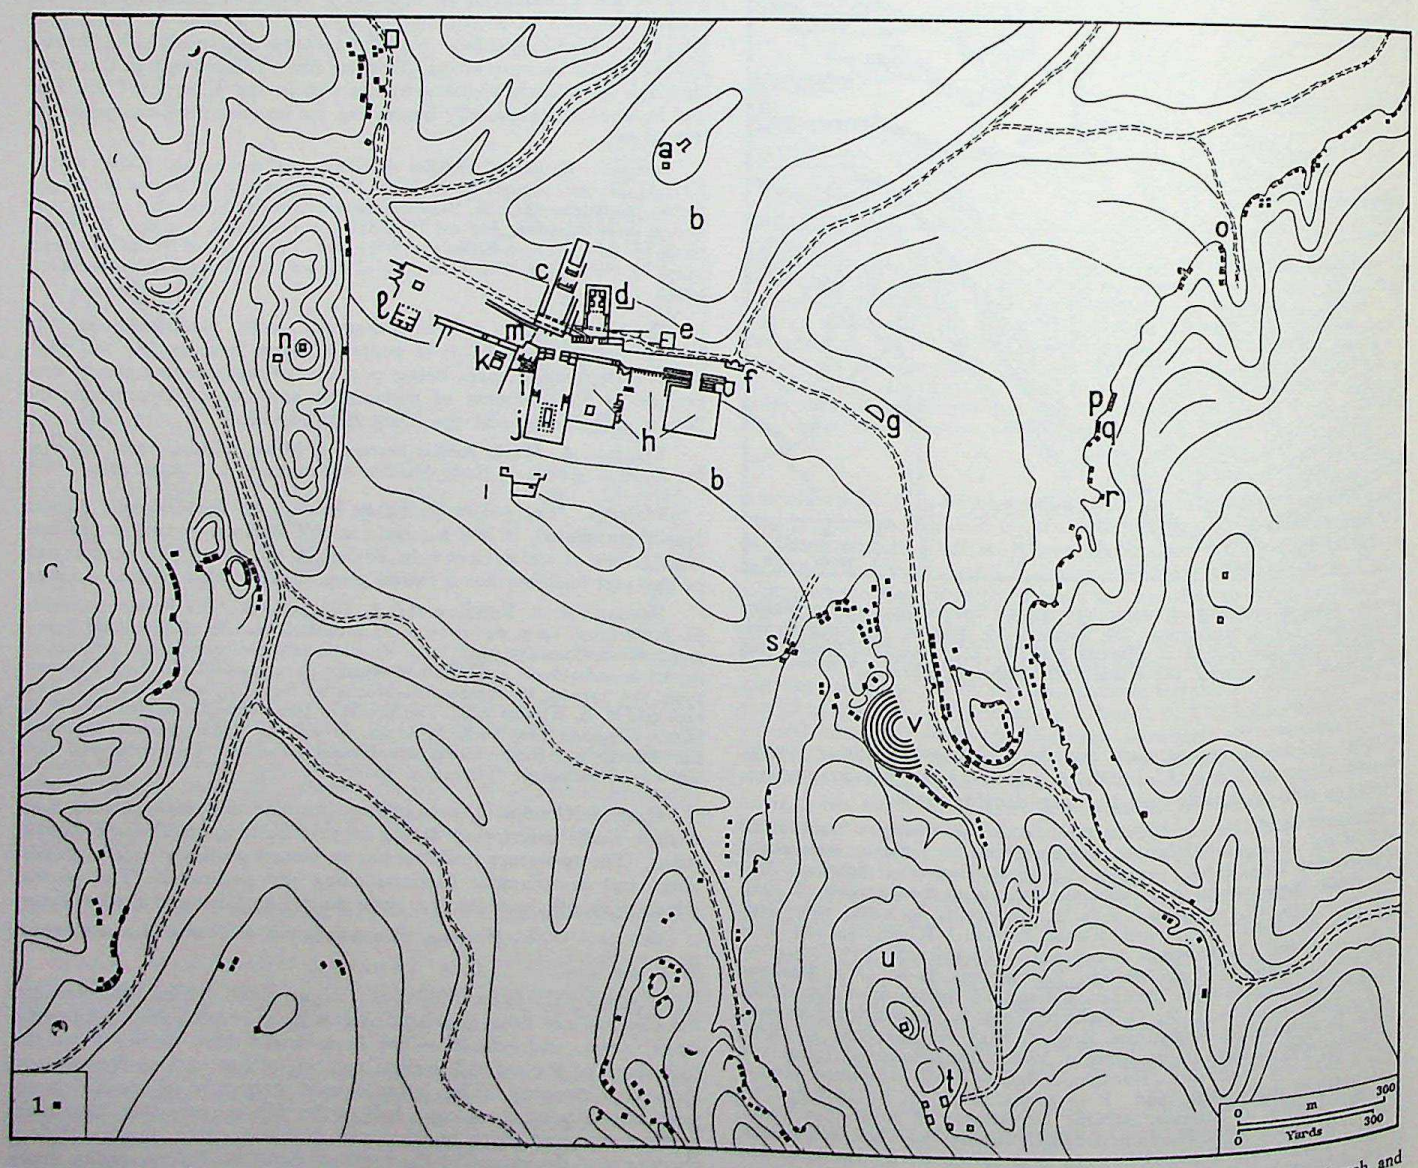
Qaṣr el-Ṭūba. An Ommiad castle located about 30 miles south of Umm el-Raṣāṣ, it is the southernmost and most remote of these structures. Never completed, it is distinctive in being constructed partly in stone, partly in brick. The central part is covered by a wide barrel vault.

Bibliog. G. L. Harding, The Antiquities of Jordan, London, 1959, pp. 159–60.

el-Lejjun (Legio). A fortified camp of about 800 × 625 ft., with towers at the corners of the walls, situated near a spring. Nearby, to the northwest, is another small camp. This site is one of the best-preserved Roman fortifications.

Bibliog. R. E. Brünnow and A. Domaszewski, Die Provincia Arabia, II, Strasbourg, 1905, pp. 24–38.

el-Karek (Le Crac, Kir Moab, Kir Haraseth). One of the principal Moabitic cities, it has no architectural remains anterior to the period of the Crusades, although fragments of Nabataean sculptures were reused in more recent walls. The citadel, on a mountain ridge, is typical of the period, containing long galleries with vaulted ceilings and arched passageways in other rooms. Notable for its decorations



Petra, archaeological map of the city and its surroundings. *Key*: (1) Tombs. Individual monuments and architectural ruins: (*a*) Byzantine church and ruins of a tower; (*b*) remains of houses; (*c*) gymnasium; (*d*) palace; (*e*) Byzantine structure; (*f*) nymphaeum; (*g*) little theater; (*h*) upper market, central market and cisterns, and lower market; (*i*) thermae; (*j*) large temple; (*k*) small temple; (*l*) "Qaṣr Fir'ūn" or "Qaṣr Bint-Fir'ūn"; (*m*) large gate; (*n*) citadel and sacrificial spot; (*o*) Tomb of Sextus Florentinus; (*p*) three-story tomb; (*q*) Tomb of the Corinthian Order; (*r*) Tomb of the Urn; (*s*) gate of the city with the ancient road; (*t*) Tomb of the Obelisks and citadel; (*u*) sacred mountain; (*v*) theater (*from A. Kammerer, Pétra et la Nabatène, I, Paris, 1929, supplemented by M. Rostovtzeff, Caravan Cities, Oxford, 1932*).

is a circular room, which originally had a domed ceiling, with ample openings all around. Largely destroyed in 1840 by Ibrāhīm Pasha, el-Kerak fell under Turkish domination in 1893. Dating from this period are the madrasah and the present mosque (built over a previous church and mosque), both constructed with material taken from medieval buildings. Among recent structures is the Italian hospital.

Khirbat el-Tannūr. Here is the only Nabataean temple ever to have been excavated. Dating from about the beginning of the Christian Era, it has an outer courtyard with an altar and small surrounding rooms, an imposing façade with columns and pillars, an inner courtyard with a true shrine, and a large altar. A large number of sculptures, some with architectural functions, were removed from the temple and are now in the Museum in Amman, outstanding among them being a statue of Zeus-Hadad, busts of the goddess Atargatis (one encircled by a band of the zodiac), Nikai, and floral subjects. The style of these works reveals a strong local reaction to Hellenistic norms. Also of interest are the fine Nabataean ceramics, with their characteristic decorations of stylized flowers.

Petra (Sela, Πέτρα). The city was situated inside a rocky area, the only means of entrance being a narrow passageway called the Siq. At the entrance to the city there are older four-sided tombs and, a little farther on, the Tomb of the Obelisks, so called because there are four obelisks on its upper story. Almost all of what remains of the city from the Roman era is carved in the rock itself, which gives it a singular appearance. The ground plan of the city, dating from the same period, was patterned after the Roman model; parts of the principal road, which was lined with columns, have been excavated recently. In addition to ruins of houses — particularly numerous in the zone of Mughār al-Naṣāra, where Nabataean inscriptions and pottery have been found — Petra also contains various public buildings of a Roman character: a theater, a temple (known as "Qaṣr Fir'ūn" or "Qaṣr Bint-Fir'ūn"), a triumphal arch, and portions of the walls. The sacrificial site, with two pillars and ruins of the priests' houses, is situated on a high, open plain. The most distinctive structures of Petra, however, are the huge façades cut from the rock, behind which are rooms serving as tombs, or, as is probable in the case of "el-Khazna" ("the treasury") and "el-Dair" ("the monastery"), actual temples (VII, FIGS. 308, 309). The most important of these structures are the tombs of the Urn, of the Corinthian Order, of Sextus Florentinus, of the Garden, of the Statue, of the Nabataean Inscription, of the Palace, of the Roman Soldier, of the Three Stories, of the Lions, and of el-Khazna and el-Dair, mentioned above. They are usually divided into two floors, with columns in the lower floor and a circular kiosk in the center of the upper floor. A notable Hellenistic influence prevails in these works. On the outskirts of the city there are also ruins of castles from the period of the Crusades.

Bellarmino BAGATTI

JUGENDSTIL. See ART NOUVEAU.

JUPÉON (or Ju Péon—French forms for Hsü Pei-hung). Chinese painter (b. I-hsing, in Kiangsu, 1895; d. Peking, Sept. 26, 1953). His father, Hsü Ta-tsang, who was also a painter, taught Jupéon the fundamentals of painting and schooled him in the traditions of Chinese art. Jupéon went to France on a scholarship granted by the Chinese government, and his long stays in Paris (1921–26) and Berlin (1927–28) decisively influenced his artistic development. In Paris, under F. Cormon, P.-A.-J. Dagnan-Bouveret, L. Flameng, and P. A. Besnard, Jupéon completed his study of European painting, both Renaissance and modern. With this experience as a basis, he sought to unite in his works the traditions of Chinese painting and the realistic tendencies of Western art, exploiting even the technical advances of the impressionists. He thus created a new, characteristic, and personal style. Upon his return to China he lived for a long period in Peking, where he divided his time between his own work and teaching. In 1949 he was named director of the Central Institute of Fine Arts in Peking, an office which he occupied until his death.

Jupéon's role in the history of modern Chinese art is an important one because he was the first Chinese artist to break the bonds of tradition while, at the same time, creating works in an unmistakable individual style. Contrary to traditional practice, he did not imitate earlier classical Chinese works but developed animal themes (PLS. 343, 344) treated by earlier painters [e.g. Han Kan, Li Kung-lin (q.v.), and Chao Mêng-fu (q.v.)] in an entirely new and personal manner. Indeed, his pictures of wild horses — his most famous works — seem in their almost infinite variety of ever new and vital poses to have come from the hand of a master who, with merely a few meaningful strokes of the ink-laden brush, has instilled in these forms his great admiration for free, untrammeled nature (PL. 343). A new technique evident in these works is the use of very wide brushes, at times tied together in order to produce special spray effects. Thus, the apparent simplicity of his drawing hides a perfection of technique which is the result of the surmounting of many difficulties (III, PL. 296). Although for Jupéon wild horses were the preferred theme, landscape also interested him, and his impressionistic paintings of the Kuei-lin Mountains and of the O-mei and Cheng-cheng Mountains in Szechwan are noteworthy. Furthermore, such allegorical paintings as *Awaiting the Liberator* (1930–33; a title derived from a passage in the *Shu-ching*, a classic work of Chinese history), *The Crowing of the Cock Before the Coming Storm* (1937), and *Angry Looks* (1939) show that he was not indifferent to the political and social history of China.

After the foundation of the People's Republic of China and his nomination to the directorship of the Central Institute of Fine Arts, Jupéon treated more explicitly political themes. He began work on two paintings — one portraying Mao Tse-tung among the people, the other representing the writer Lu Hsün with the young revolutionary author Chu Chiu-pai — but died leaving them incomplete. Thus it is impossible to judge the works of his last period, especially since he devoted himself primarily to teaching in his later years.

Most of Jupéon's works are now in the Jupéon Museum, founded in 1954 in Peking, near the artist's home. The publishing by the Jung Pao Chai Studio in Peking of many excellent reproductions of these works (especially of the paintings of wild horses) has done much to further knowledge of Jupéon's art in the Western world.

JUSTUS OF GHENT (Joos van Gent; to his Italian contemporaries Giusto da Guanto). The only documented work by this artist is the *Communion of the Apostles* in Urbino (Gall. Naz. delle Marche), which was painted in 1473–74 for the Confraternity of Corpus Domini in that city. In 1475 he agreed to paint a banner for the same confraternity, but after this there

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

is no mention of him in the documents of Urbino. Federigo da Montefeltro's librarian, Vespasiano da Bisticci, asserted that because the duke could not find an Italian artist to his taste who knew how to paint in oil, he had summoned a talented Fleming. It is therefore likely that Justus of Ghent is identical with a Flemish artist named Joos van Wassenhove, who is mentioned in several Netherlandish documents between 1460 and 1468. The artist joined the painters' guild in Antwerp in 1460 and four years later was admitted to the guild in Ghent. When Hugo van der Goes sought admission to the latter body in 1467, Joos van Wassenhove was his guarantor. The last mention of him occurs in a text of 1475 that records how Hugo advanced him money when Joos set out on a journey to Rome.

Three works have been ascribed to Justus of Ghent in the years before he went to Italy: the large triptych with the Crucifixion (V, PL. 280), another Crucifixion (Brussels, Coll. Baron Descamps), and the *Adoration of the Magi* (New York, Met. Mus.). These works show a considerable resemblance in style to the paintings of Hugo van der Goes. There is also, however, a strong reflection in them of Dirk Bouts, especially of his characteristic isolation of figures in space.

The *Communion of the Apostles*, though clearly related in types and handling to the works ascribed to Joos's earlier Netherlandish period, shows a distinct advance over them in technical mastery. It contains portraits of Federigo and his court which are impressive statements of personality, the composition is much more unified, and there is a new ability to render movement. The subject is highly original, picturing Christ not in the act of instituting the Eucharist by breaking bread, but as a priest delivering to each communicant the consecrated wafer.

Twenty-eight paintings that once decorated Federigo's *studiolo*, of famous men of the past, are the most important of the works generally attributed to Joos after the *Communion*. They are now divided equally between Urbino and the Louvre. There are also a portrait of Federigo reading (Urbino, Gall. Naz. delle Marche), a painting of him with his court attending a lecture (Windsor, Royal Colls.), and a pair of allegorical pictures representing Rhetoric and Music (London, Nat. Gall.) which, like two others destroyed in Berlin during World War II, may have formed part of a series of the Liberal Arts. In an unconvincing attempt to account for the striking development of his style under the influence of Italian art and Humanism, the names of the Italian painter Melozzo da Forlì and the Spaniard Pedro Berruguete have been proposed as collaborators of Justus in his later paintings at Urbino, and some scholars have even ascribed the works to one or the other of these artists.

BIBLIOG. Friedländer, III, 1925; J. Lavalleye, Juste de Gand, peintre de Fédéric de Montefeltre, Louvain, Rome, 1936; Musée des Beaux-Arts, Juste de Gand, Berruguete et la Cour d'Urbino, Ghent, 1957 (exhib. cat.).

Margaretta M. SALINGER

JUVARA (JUVARRA), FILIPPO. The leading Italian architect of the 18th century (b. Messina, Mar. 27, 1678; d. Madrid, Jan. 31 or Feb. 1, 1736). At an early period he was doubtless influenced by the works of Guarino Guarini (q.v.) in Messina, but his real training took place in Rome under Carlo Fontana, the most eminent practitioner of an academic late-baroque style. Fontana is said to have told Juvara to forget all he had previously learned and to start again, perhaps in order to discipline the riotous fantasy inherent in Juvara's Guarinesque background. His surviving drawings (e.g., the sketchbook in London, Vict. and Alb.) for the theater and for other ceremonial occasions from the period of ten years he spent in Rome (1703/04–14) as a designer are evidence of his fantasy and powers of invention. The classical discipline imposed by Fontana helped him to become a learned and eclectic architect, and his later buildings are characterized by sophistication and restraint.

In 1714 he returned to Messina and began a royal palace for the new king of Sicily, Victor Amadeus II, but by the end of the year he had settled in Turin as the King's First Architect. During the next twenty years he was responsible for a vast amount of work in Turin, including his three masterpieces, — the Palazzo Madama; the royal hunting lodge at Stupinigi, near Turin; and the church and monastery of the Superga also just outside Turin.

The Palazzo Madama was an older building refronted by Juvara (1718–21; PL. 226) with a screen façade leading directly into a very large and grand staircase hall. The façade shows an awareness of Versailles but is a summary of the classic Italian palace type. It has a rusticated basement with *piano nobile* and mezzanine above and is distinguished by an order of pilasters (here, columns in the three central bays). The vast hunting lodge at Stupinigi (1729–33) is based on a cross plan with two arms extended to form an enormous seven-sided court and with a great central, oval, domed hall as the focal point (I, PLS. 389, 407; II, PL. 141). The rich decoration recalls Juvara's practice as a stage designer. His most important church — the huge basilica of the Superga (1717–31 and later), located on the top of a 2000-ft. hill near Turin — combines a church and a monastery, the entire structure dominated by the very high dome above the entrance portico (II, PL. 140). The church is built into the monastery in a way that indicates knowledge of contemporary Austrian buildings.

Juvara's firsthand acquaintance with buildings outside Italy was considerable: in 1719–20 he went to Portugal and designed a royal palace, and in 1720 he traveled to Paris and then to London. In 1735 he went to Madrid to design a palace (II, PL. 160) for Philip V (the model still exists), but died soon thereafter.

BIBLIOG. L. Rovere, V. Viale, and A. E. Brinckmann, Filippo Juvarra, Milan, 1937; R. Wittkower, Art and Architecture in Italy, 1600 to 1750, Baltimore, 1958, pp. 275–82.

Peter MURRAY

KAIKEI. Japanese sculptor of the early Kamakura period, active ca. 1189–1221.

The two most famous sculptors of the Kamakura period (1185–1392) were Unkei and Kaikei, respectively the son and pupil of Kōkei. They worked in the same atelier and sometimes on the same commissions, notably the *Kongōrikishi* (1203) or "Guardians" of the Tōdaiji monastery in Nara. Their workshop, the Shichijō Bussho at Nara, was the most popular one of the time. Despite Kaikei's fame, however, comparatively little is known about his life.

The civil wars preceding the establishment of the militaristic regime which governed Japan from its headquarters at Kamakura had resulted in much damage to the temples of the old capitals of Nara and Kyoto and to the treasures they contained. The restorations, inspired by priests such as Chōgen of the Tōdaiji, were often entrusted to the workshop of Unkei and Kaikei. Kakei was even accorded ecclesiastical rank for his services.

At that time Buddhism was developing into a universal religion rather than one reserved for the upper classes. The work of the period thus shows a preference for straightforward, comparatively unesoteric interpretations of religious images. Artistic activity was centered in Nara, amid the sculptural masterpieces of the ancient capital, and contributed to their restoration. It was natural that this new activity should inherit the traditions and techniques not only of the preceding late Heian (Fujiwara) period but also reflect the simple faith of earlier centuries rather than the later, more complicated forms of Buddhism. The Kamakura period is thus considered by most historians as a renaissance of Nara ideals, lacking something of the nobility of earlier work, but surpassing it in power, intensity, and vigorous naturalism.

Diplomatic relations with China, interrupted during the Fujiwara period, were reestablished. Priests and workmen traveled between the two countries and, as a result, Chinese art once again exerted a strong influence on the products of Japanese artists and craftsmen. The images of the period also reflect the newly imported styles of Sung China — especially in the full, soft faces with their gentle expressions, and in the delicate flowing drapery. The complicated effects demanded in sculpture were achieved by the perfection of such artists

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

949

as Unkei and Kaikei, with the aid of newly introduced techniques, such as the use of numerous roughly carved pieces of wood which were then assembled for the finishing touches of the master.

The *Miroku* (Maitreya), Kaikei's earliest surviving work (1189; formerly in the Kōfukuji, Nara, and now in Boston, Mus. of Fine Arts), follows the Sung norms — a gentle softness of body and a pretty face, with elegant, natural drapery, harmoniously arranged — to produce a vision of transcendent beauty. The figure of the god Hachiman as a Buddhist priest (1201; PL. 295) in the Tōdaiji is in the popular tradition of realistic priest portraits, but, although the surface is beautifully decorated, the figure is somewhat uninspired. The standing *Jizō Bosatsu* (Kṣitigargbha), also in the Tōdaiji, was made between 1201 and 1211; its decoration includes crystal eyes, painted floral designs, and lavish use of cut gold leaf. The *Kongōrikishi* (*Niō*; PL. 291) of the Great South Gate (Nandaimon) of the Tōdaiji, were made by Unkei, Kaikei, and pupils in about two months of 1203. They are about 27 ft. high, the largest wooden sculptures in Japan. Figures of terrifying grandeur, they faithfully reflect traditions which can be traced to the Chinese guardians of early T'ang dynasty cave temples (see CHINESE ART). Kaikei's last known work, the *Amida* (Amitābha) in the Kōdaiin (Wakayama prefecture), dates from 1221. Like a number of sculptors of the period, he sometimes copied earlier works, and his *Shūkongōjin* ("Menacing Guardians of Buddhism") in the Kongōin (Kyoto prefecture) are copies of originals in the Tōdaiji.

WORKS: *a. Works by Kaikei alone*: Standing *Miroku*, 1189, Boston, Mus. of Fine Arts. – Seated *Miroku*, 1192, Kyoto, Sambōin. – Standing *Amida*, ca. 1194, Kyoto prefecture, Kongōin. – Seated *Shaka*, 1197, Otsu, Shiga prefecture, Empukuin. – *Kujaku Myōō*, 1200, Kōyasan, Wakayama prefecture, Kongōbuji (PL. 345). – *Sōgyō Hachiman* (the god Hachiman as a Buddhist priest), 1201, Nara, Tōdaiji (PL. 295). – Standing *Jizō*, 1201–11, Nara, Tōdaiji (PL. 345). – Seated *Amida*, 1202, Awa, Mie prefecture, Shin-Daibutsuji (some scholars hold that only the head is original). – Seated *Fudo Myōō*, 1203, Kyoto, Sambōin (PL. 345). – Standing *Amida*, 1208, Nara, Tōdaiji. – Standing *Miroku*, Nara, Tōdaiji (PL. 345). *b. Works in collaboration with Unkei*: Standing *Amida*, before 1203, Kyoto, Saihōji. – *Shinsha Taishō*, Kyoto prefecture, Kongōin. – Standing *Amida*, before 1203, Kōyasan, Wakayama prefecture, Henjōkōin. – *Dainichi*, before 1203, Nara, Enjōji (PL. 292). – *Kongōrikishi* (*Niō*), 1203, Nara, Tōdaiji, Nandaimon (PL. 291). – Standing *Amida*, 1204, Okayama prefecture, Tōjuin. – Standing *Amida*, 1221, Nara prefecture, Korinji. – *Amida*, 1221, Kōyasan, Wakayama prefecture, Kōdaiin. – *Jūdai Deshi* (*Ten Great Disciples*), Kyoto, Daihōonji. – Standing *Amida*, Nara, Saihōin. – Standing *Amida*, Kyoto, Daigoji. – *Shūkongōjin*, Kyoto prefecture, Kongōin.

KALAMIS (Κάλαμις, CALAMIS). Greek sculptor who seems to have been active in the late-archaic and early classical periods (ca. 480–450 B.C.). Nothing is known of his origins or artistic training. His connections with Pindar and Boeotia have led many to suppose that he was a Boeotian. On the other hand, many scholars have held him to be an artist of Attica, while still others have emphasized the Peloponnesian elements of the works commonly ascribed to him.

Kalamis is generally mentioned among the major artists of the classical period, on the same plane as Onatas, Myron (q.v.), Phidias, and Polykleitos (qq.v.); the fact that his name is customarily cited in the line of development as traditionally summarized in ancient sources is undoubtedly owing not so much to the preeminence of his work in itself as that it was a milestone marking the achievement of triumphs over obstacles, an important turning-point.

Ancient references to Kalamis, aside from occasional mention of him in connection with a specific work, seem to fall into two groups which various scholars have felt to be incompatible. Cicero (*Brutus*, xviii, 70) and Quintilian (*Institutiones oratoriae*, XII, x, 7) place him in a middle ground between the archaic rigidity of Kallon or of Kanachos and Myron's greater freedom of form. A statement by Dionysios of Halikarnassos (*On Isokrates*, 3) has been held to be in opposition to this chronology; here Kalamis is connected with Kallimachos and praised along with him for his subtlety and grace (χάρις καὶ λεπτότης). Such a characterization, considered by many to be inconsistent with the statements of Cicero and Quintilian, has been related instead to references which describe Kalamis as the teacher of Praxias (Pausanias, *Description of Greece*, X, xix, 4) and as "collaborator" with Skopas and Praxiteles (Scholia to Aischines, *Against Timarchus*; Pliny, *Naturalis historia*, xxxiv, 71). In addition, since Pliny twice mentions a Kalamis as an engraver or "caelator" as though in opposition to the bronzeworker, various scholars have presumed the existence of a second Kalamis, active perhaps in the beginning of the 4th century and in every respect the opposite of his archaic predecessor.

Actually, the fact that the ancient authors speak freely of a great sculptor named Kalamis and never once refer to the existence of a minor artist of the same name who might be confused with him seems to prove that, as far as they were concerned, there was only one Kalamis. Pliny's apparent distinction may be discounted as an artificial separation by which the same artist is placed in different categories according to the various types of artistic activity under discussion. At the same time, the supposed collaboration with Skopas and Praxiteles may be understood to mean that works by Kalamis were completed by more recent sculptors decades or even more than a century later. The placement of Kalamis precisely between the late-archaic and the classical periods agrees with ancient accounts that Kalamis was commissioned to execute statues for Hieron I, for Pindar, and for Kallias, Kimon's son-in-law; he therefore belongs in the second quarter of the 5th century.

Kalamis was famous for his sculptures of horses (Propertius, III, ix, 10; Ovid, *Ex Ponto*, IV, i, 33). Besides various other unspecified two- and four-horse chariots, he fashioned race horses with boys riding on them for a chariot group, the work of Onatas, dedicated by Hieron at Olympia (Pausanias, VI, xii, 1). The ex-voto of the people of Akragas (Agrigento), also at Olympia, must have been just as splendid with its *choros* of boys in bronze. Other works of Kalamis mentioned in literature are the statue of Apollo Alexikakos that was in Athens; a colossal statue of Apollo made for Apollonia on the Pontos Euxeinos (Black Sea), taken to Rome by Lucullus; and a third Apollo "in hortis servilianis" (Pliny, *op. cit.*, xxxvi, 36). There are also references to a Dionysos and a Hermes Kriophoros for Tanagra, a Zeus Ammon dedicated by Pindar in Thebes, and a bearded chryselephantine statue of Asklepios in Sikyon. Many scholars identify the statue of an unnamed divinity, the so-called "Sosandra" from the Acropolis, as the Aphrodite that was recorded in sources as having been dedicated by Kallias on the Acropolis (PL. 346). Kalamis has also been credited with a Semne (Erinys) that was placed between two others, executed by Skopas, which were evidently not so old nor so imposing as the first one; a Nike Apteros (Wingless Victory) made for Olympia; and a statue of Hermione, an ex-voto of the Spartans in Delphi. The attribution of a statue of Alkmene is less certain, since it is based on a corrupt passage in Pliny (*op. cit.*, xxxiv, 71). There also remained in the Villa Celimontana (Mattei), Rome, at one time, the transcription of an inscription, now lost, of still another sculpture, possibly a statue representing Iphitos.

This relative wealth of documentation would seem to present the image of an attractive and well-defined artistic personality — as seen, particularly, from the interesting allusions of Lucian, himself a sculptor (*Eikones*, 4, 6; *Dialogues of the Hetairai*, III, 2) — or, in any case, one famous enough for works of his to be presumed to have survived at least in Roman copy. It is therefore not surprising that art historians have tried for

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

a century and a half to reconstruct the real artistic personality of Kalamis and to recognize his works from the vague references found in the authors of antiquity. But the rather discouraging results produced by this evidence are confusion and contradictory hypotheses. Sometimes a refined and archaizing Kalamis emerges, at other times a more rigid Kalamis working in the traditions of the Peloponnesos, or, if the emphasis is shifted to a "collaboration" with Skopas and Praxiteles, a Kalamis of the mature classical period who must be placed at the end of the 5th or in the first half of the 4th century.

At one time or another almost all the famous statues of the late-archaic period and many from the mature phase of classical art were ascribed to this elusive artist. The *Apollo Belvedere* (III, PL. 383) has been proposed for the Apollo Alexikakos; so have the *Apollo* from the Tiber and the *Apollo* from the Omphalos at Delphi (III, PL. 353). The statuettes in the Pembroke Coll. (Wilton) and in the Museo Barracco (Rome), the original of an archaizing altar on the Acropolis, and various terra cottas and small bronzes have all been put forward as representing his Hermes Kriophoros. The Sosandra with veiled head has been recognized in the *Hestia* Giustiniani, in the so-called "Aspasia Amelung" — another copy of which was recently discovered at Baia (PL. 346) — in a veiled dancer known especially through reliefs, in the Cherchel *Demeter* (or Venus) in Algiers, and in the *Aphrodite* of Fréjus. Others assert that the Aspasia represents his Semne, and the Barberini *Suppliant* has been identified as either the Nike Apteros of Olympia or as the Semne. The Hermione has been tentatively associated with a running figure of a *peplophoros* in the Ny Carlsberg Glyptotek (Copenhagen) and with an Atalanta once in the Holland Collection. During the past fifty years, all the important sculptures in the severe style have been linked to Kalamis at one time or another. Occasionally, as in the case of the *Penelope* in the Vatican that has been connected with the so-called "Alkmene," they have been identified with works mentioned in sources, but at times even such vague evidence has been lacking. Thus the so-called "Ludovisi Throne" (VII, PL. 63), the *Atalanta* in the Galleria dei Candelabri (Vat. Mus.), the *Eros* Soranzo, the "Humphry Ward head" in the Louvre, the archaizing *Amazon* in Vienna, the *Boy Removing a Thorn* (Conserv.) the *Charioteer* of Delphi (III, PL. 346), the *Charioteer* (Conserv.), the Esquiline *Aphrodite* (VII, PL. 365), the severe *Athena* wearing the peplos (Rome, Mus. Naz.) — all have been ascribed to Kalamis. The two sculptures on which there is most agreement are the *Apollo* from the Omphalos which is identified with the Apollo Alexikakos, and the "Aspasia" in which many see either the veiled Aphrodite dedicated by Kallias or a Demeter, Europa, or some other divinity. The attribution to Kalamis of the *Apollo* from the Omphalos, on the other hand, brings with it that of the *Zeus* (or Poseidon) from Artemision (III, PL. 356), which has been judged by many to be inseparable from the Apollo. Others have instead assigned these two statues to Myron or to a Peloponnesian school.

In the most recent and authoritative history of Greek sculpture, G. Lippold limits his treatment of Kalamis to an analysis of the literary sources and of some coins presumably representing the colossal Apollo of Apollonia and the Dionysos and the Hermes of Tanagra; he only points out certain elements which the Apollo on the coins and the *Apollo* from the Tiber have in common. Following the lead of the greatest scholar of Kalamis, F. Studniczka, it must be admitted that in the case of this fascinating and mysterious figure there is absolutely no proof for any certain attribution.

KANDINSKY, WASSILY. Painter and graphic artist (b. Moscow, Dec. 4, 1866; d. Paris, Dec. 13, 1944). Kandinsky began his studies at the Gymnasium in Odessa in 1876, and in 1886 entered the University of Moscow to study law. In 1889 he traveled to the province of Vologda as a member of an ethnographic expedition and visited The Hermitage in St. Petersburg, where he was particularly impressed by the Rembrandts. In 1892 he passed his law examination, and the following year he accepted a position on the law faculty. He was greatly affected by a large exhibition of French impressionism — and especially by Monet — held in Moscow in 1895. In 1896 he refused an invitation to join the faculty of the University of Dorpat (Tartu) and instead left for Munich to study painting. There he studied first at the Azbé School, where he met his compatriot Alexej von Jawlensky (b. 1864). In 1900 he attended the classes of Franz von Stuck at the Munich Academy, in which Paul Klee (q.v.) was also enrolled.

In Germany Kandinsky came under the influence of the then dominant Jugendstil. Beginning in 1902, he executed numerous woodcuts, painted landscapes and romantic subjects in oil and tempera, and in 1905 began to paint scenes of Russian life, such as the *Troika*, in a broad-dot technique. Many of these early works are preserved in the Münter bequest in the Städtische Galerie in Munich. Between 1903 and 1908 Kandinsky made several trips. In 1903 he visited Venice and in 1904, Holland. From December, 1904, until April, 1905, he traveled in Tunisia, and from December, 1905, until April, 1906, he was in Rapallo. He was in Sèvres near Paris from June, 1906, to June, 1907, and in 1908 returned to Munich. From 1909, when he and the painter Gabriele Münter acquired a house in Murnau, until the beginning of World War I in 1914, he lived and worked in Murnau and Munich. Gabriele Münter was with him from 1902 until 1914.

Kandinsky's landscapes of Murnau are his first original works (cf. V, PL. 264). In 1909 he began his series of *Improvisations* (PL. 349); in 1910, his series of *Compositions*; and in 1911, his *Impressions*. By "impressions" Kandinsky meant paintings which retain an impression of exterior nature, by "improvisations," paintings which arise from an inner emotion, and by "compositions," paintings which are built up from preliminary studies and into whose construction the painter's consciousness enters. Kandinsky painted six *Impressions*, all in 1911; thirty-five numbered *Improvisations*, between 1909 and 1914, in addition to three which bear A-numbers and five not numbered; seven *Compositions* between 1910 and 1913 and three more dated 1923, 1936, and 1939, making a total of ten *Compositions* in all. His first abstract water color dates from the end of 1910.

In 1909 Kandinsky helped found the Neue Künstlervereinigung, out of which the Blaue Reiter was formed in 1911 (V, PL. 211). The first Blaue Reiter exhibition was held from Dec. 18, 1911, to Jan. 1, 1912; the second, an exhibition of graphic works, in February, 1912. Kandinsky's two principal writings also appeared in 1912. They are *Über das Geistige in der Kunst*, completed in 1910, and the important article, "Über die Formfrage," which was published in *Der Blaue Reiter* along with his poetic drama, "Der gelbe Klang." In 1913 he published the *Klänge*, a series of prose poems with accompanying woodcuts, and the *Rückblicke*, his autobiography. The years 1910–1914 are perhaps Kandinsky's best period. His paintings of this time open up a new chapter in art history. In them objects gradually lose their optical reality in favor of an absolute reality (V, PL. 126); representation of nature is replaced by a "spiritual" image whose laws depend upon an "inner necessity." Kandinsky was

UP State Museum, Lucknow

953

not doctrinaire; until 1914 he did not completely abandon representation. Although he had no rigid principles about form, he developed a theory of harmony similar to that proposed by the composer Arnold Schönberg in 1911. Particularly interesting for artists are Kandinsky's detailed investigations of form and color and their interrelationships.

Kandinsky's most productive period was that of the Blaue Reiter. It was at this time that he created the paintings upon which his reputation rests. To these belong the *Compositions*, *Improvisations 10* (1910), *20* (1911), *30* (1913), and *35* (1914), *Painting with White Forms* (1913), *Painting with Red Spot* (1914), and *Fugue* (1914). A large number of his major works are now in the Guggenheim Museum in New York (PLS. 349, 350). His *Compositions VI* and *VII* (1913) are in the Tretyakov Gallery in Moscow.

At the start of the World War in 1914 Kandinsky returned to Russia. He lived in Moscow until the end of 1921, working little during the war and revolution. In 1917 he married Nina Andreevsky and in 1918 became a member of the Fine Arts Division of the Commissariat for Public Instruction and a professor in the Government Art Workshops. While in Russia he published his *Rückblicke* in Russian with addenda. Kandinsky left Russia in 1921 for Berlin. In the summer of 1922 he went as an instructor to the Bauhaus in Weimar, where he once again met Klee and Lyonel Feininger (q.v.), whom he had known earlier. Along with Klee, Feininger, and Jawlensky he founded the Blaue Vier (Blue Four), in 1924, a group which showed both in Europe and America. In 1925 he moved with the Bauhaus to Dessau. The following year his book on the theory of art, *Punkt und Linie zu Fläche*, appeared in the Bauhaus book series. He acquired German citizenship in 1928, and in the same year he staged Mussorgsky's *Pictures at an Exibition* at the Dessau Theater. His first Paris exhibition took place in 1929, and in 1933 with the suppression of the Bauhaus he moved to France, going to live in the Paris suburb of Neuilly-sur-Seine. He remained in France, becoming a French citizen, until his death on Dec. 13, 1944.

Kandinsky himself described his years spent at the Bauhaus as a "cold period" and his years in Paris as a time of synthesis. *Composition VIII* (1923) is typical of his geometric constructions: geometry becomes number and number is transformed into magic. Kandinsky's development was undoubtedly affected by his years in Moscow. His compositional technique became more apparent at that time, but without weakening the picture's inner expression. *Punkt und Linie zu Fläche* contains the start of Kandinsky's theories on harmony, which he was unfortunately never able to complete because of his teaching duties and the disruptive effect of his move to Paris. The scope of the book is stated in his description of the goals of research: "precise investigation of each individual phenomenon — in isolation; the reciprocal effect of phenomena upon each other — in combinations; general conclusions to be drawn from the preceding sections."

A certain naturalism of forms appears in Kandinsky's pictures of the Bauhaus period. Instead of forms, one may speak rather of figures which conform, as in nature, to a structural law of "inner necessity." Kandinsky's Munich paintings had had a romantic quality; his work now took on a classicistic note. Among the major works of this period are the *Composition VIII* (1923), *Through-going Line* (1923), *Black Accompaniment* (1924), *Yellow-Red-Blue* (1925), *Several Circles* (1926), *On Points* (1928), and *Slowly Out* (1931). Prior to 1922 Kandinsky's titles are in Russian, from 1922 to 1934, in German, and from 1934 on, in French.

Kandinsky's Paris period is marked by a great serenity and fullness. In the 144 canvases and 209 water colors produced during these 11 years, Kandinsky summed up his experiences of three decades (PL. 350). In articles he wrote in Paris he placed emphasis on the synthesis of mind and heart, of compositional technique and intuition. Now he also preferred the expression "concrete" to the concept "abstract."

As often happens in old age, memories of Kandinsky's youth and of his stay in Moscow appear in the works of his last years. His late paintings take on a richness of color that is more Asiatic than European and a passionate rhythm of movement; in their sensuous unreality, they seem baroque. The composition may lead the viewer at first to imagine that he sees actual objects, but Kandinsky's achievement is, rather, the creation of a new figural mythology. Kandinsky's most important works of the Paris period are: *Compositions IX* and *X* (1936 and 1939), *Movement I* (1935), *Dominant Curve* (1936), *Center with Accompaniment* (1937), *Red Circle* (1939), *Various Parts* (1940), *Reciprocal Accord* (1942), and *Tempered Elan* (1944, his last painting).

KANŌ SCHOOL. The Kanō school was founded by Kanō Motonobu (1476–1559), whose style represents the fusion of the Chinese technique of ink painting with the color and vivacity of the Tosa school (q.v.), which, to some extent, was related to the traditions of Yamato-e (q.v.). The Kanō school was active for several centuries. It flourished first in Kyoto, the imperial capital in the Muromachi and Momoyama periods (see JAPANESE ART). In the Edo period (1615–1867) members of the Kanō family began to move to Edo (mod. Tokyo), the new capital of the military dictators, where they became the official artists of the shogunate regime. The provincial adminis-

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

trators, in imitation of the central government, also called Kanō artists to work for them, with the result that the style was diffused over almost the entire Japanese territory. The official position reached by the Kanō painters lowered the quality of their art, which hardened into academicism and inertia, while the vitality of Japanese art found its expression more and more in Ukiyo-e (q.v.).

SUMMARY. Introduction (col. 955). Kanō Masanobu and Kanō Motonobu (col. 955). Kanō Eitoku (col. 956). Kanō Tanyū (col. 958). The Edo-Kanō school (col. 959). The Kyō-Kanō school (col. 960). The Kanō school and modern Japanese painting (col. 960).

INTRODUCTION. Both secular court painting and religious painting of Buddhist inspiration were introduced into Japan from China. During the Heian period (794–1185) the way of life of the court nobles became more purely Japanese, a change that is reflected in the paintings of the time. That is to say, artists depicted both the natural beauties of Japan and Japanese life as they themselves saw and experienced them. These works, which began to appear in the 10th century, were quite different in form and style from Chinese paintings and are called Yamato-e (Japanese painting) in contrast to Kara-e (Chinese-style painting), which continued to be practiced at the same time.

In the Kamakura period (1185–1333) the two styles continued to exist together, but the introduction of *sumi-e* (India-ink drawing) revolutionized Kara-e. The *sumi-e* works, brought to Japan from China by Ch'an (Jap., Zen) priests and returning Japanese Zen priests, were collected and preserved in Zen temples in Japan. *Sumi-e* had originally developed in China as a type of secular painting and had little to do with Zen, but since the *sumi-e* works in Japan were introduced by Zen priests, they naturally had some relation to the Zen sect, and the appreciation of *sumi-e* was primarily from the standpoint of Zen Buddhism. Early in the Muromachi period (1334–1573) Zen priests began to produce *sumi-e* whose subject matter was the Zen ideal of spiritual awakening. Thus was born the Japanese *sumi-e*. At this time also landscape paintings were introduced from China, and the most important development in *sumi-e* was the growth of Kara-e landscapes. Numerous *sumi-e* landscapes were produced; Shūbun (active 1st half of 15th cent.) and Sesshū (q.v.; 1420–1506) were the outstanding exponents of this type of painting. The 15th century was the golden age of *sumi-e*. *Sumi-e*, born and developed in the Zen temples, was also studied and practiced by lay painters, and the first great *sumi-e* artist who was not a priest was Kanō Masanobu.

KANŌ MASANOBU AND KANŌ MOTONOBU. The Zen priests of the Muromachi period were not only priests but also distinguished men of letters, who held literary meetings at which they composed poems or wrote essays in Chinese, chiefly in appreciation of the beauty of nature. They had artists draw *sumi-e* of the scenes that had inspired their poetry, giving rise to the custom of the priests of adding poems of their own composition on the upper space of the picture. Picture and poem therefore formed an artistic whole; this type of production was named *shigajiku* ("poem-picture roll"). Landscape *sumi-e*, an expression of the poetic state of mind, were also drawn on the fusuma (sliding doors) and *byōbu* (sliding panels) of Zen monasteries.

The ruling Ashikaga family and the military class were much influenced by the way of life and the ideals of the Zen priests. Shūbun, the acknowledged master of the Zen priest-artists, occupied the post of official government artist. After his death the post was given to Sōtan, another Zen priest-artist, who was in turn succeeded, in 1481, by Kanō Masanobu (1434–1530?). The ancestors of Masanobu belonged to the warrior class, and his father seems to have become an artist. Masanobu had gone to Kyoto to learn *sumi-e* under Shūbun and had been a fellow student of Sōtan.

The fact that a layman such as Masanobu could study *sumi-e* and finally come to occupy the highest position in that field shows that *sumi-e*, developed by the priesthood, had by then spread among the military and other secular classes. Three of Masanobu's works are in Tokyo (Nat. Mus.), one of which is titled *Chou Mao-shu* (Jap., Shūmoshuku) *Admiring Lotus Flowers* (PL. 351). So few are his extant works that critical judgment is difficult. His first work is known to have been paintings on the fusuma of a Zen temple in 1463. In 1483 he painted the fusuma in the Higashiyama Mansion (later Jishōji, popularly known as the Ginkakuji) of Ashikaga Yoshimasa, and he also painted many other fusuma in temples and in the residences of the military lords.

The *sumi-e* Masanobu made for his military patrons were naturally different from those painted by the Zen priests for their temples, and it may be said that his works were held in high esteem because of the difference. In these *sumi-e* the character and ideals of Zen began to be replaced by motifs of secular inspiration. Kanō Motonobu (1476–1559), the eldest son of Masanobu, developed the secular aspect of his father's style into an independent school of painting and consequently established *sumi-e* as the painting of the military classes. Motonobu studied *sumi-e* under his father, after whose death he was named official government artist by the Ashikaga shogunate. He was given the ecclesiastical rank of *hōgen* in his later days. Of the many fusuma paintings he executed in temples and in the mansions of the warriors, his best works were those in the original Nishi Honganji (at that time in Ishiyama, Osaka) of the Jōdo-Shinshū sect, on which he worked for several years beginning in 1539. His extant works include a group of 8 paintings of flowers and birds (PL. 313) in the Daisenin of the Daitokuji and another group of 49 paintings of flowers and birds (PL. 357) and of landscapes in the Reiunin of the Myōshinji. These were originally fusuma paintings, but they have been made into hanging scrolls to preserve them.

The *sumi-e* landscape before Motonobu represented an ideal landscape, combining the Zen view of nature with the view of nature as seen by the Japanese poets who composed Chinese poems. Motonobu's landscapes, however, represented the breadth and vitality of real nature. His flowers and birds expressed the beauty and variety of forms and colors. In short, he attempted to reproduce in his work, as realistically as possible, the object itself. His technique consisted chiefly in the use of bold lines and thick ink, with the addition of suitable gradations of color. This vigorous style could no longer be called pure *sumi-e*, differing as it did from both that of previous priest-artists and from the mixed style in which *sumi* (India ink) and colors were employed.

In the original *sumi-e* the use of color was generally avoided, and the rare times when it was used (usually red ocher and indigo) were only to accentuate the image. Therefore the fact that Motonobu habitually used thick *sumi* and strong colors represented a new departure in the field of *sumi-e*. His color technique was that of Yamato-e, and his use of the *sumi* of Kara-e together with the colors of Yamato-e resulted in a new style and technique. In other words, he combined Chinese and Japanese styles and methods. The poetic character, inspired by Zen ideals, which had marked the earlier *sumi-e* almost disappeared, and there emerged an art which emphasized magnificent effects. The new decorative style was well suited to the tastes of the military aristocracy and can therefore be called the painting of the warrior class. Motonobu's descendants and the many disciples who followed his manner are generally known as the Kanō school.

KANŌ EITOKU. Among Motonobu's children, his third son Kanō Tadanobu (Shōei; 1519–92) faithfully carried on his father's style and assisted him in commissions for many temples and mansions. During Shōei's life the power of the Ashikagas was already declining, and the government could not afford to have an artist in service after the death of Motonobu.

Kanō Eitoku (1543–90), the eldest son of Shōei, maintained the traditional style. His youth was passed during a time in which the struggle for power among the military lords was destroying the Ashikaga government. In 1573, when Eitoku was thirty, Oda Nobunaga seized the reins of government from the Ashikagas. In 1589 Toyotomi Hideyoshi became master of the entire country.

957

Oda Nobunaga built a castle at Azuchi, which was the center of military affairs and administration. This castle contained both Nobunaga's residence and government buildings. The pillars, ceilings, *ramma* (frieze between pillars and ceiling), fusuma, and *byōbu* were decorated with paintings and carvings, and Eitoku supervised the work. Nothing remains of the castle. It is known only that the pillars were lacquered and were decorated with gold, silver, and polychrome paintings and that, to harmonize with them, the fusuma were decorated with magnificent pictures in thick colors on a gold ground. There were also fusuma paintings in only black and white, which were no less decorative. The subjects of these fusuma paintings were the same Buddhist and Confucian themes used in the Kara-e and Yamato-e of the Muromachi period, as well as traditional subjects such as landscapes and flowers and birds (PLS. 318, 353). Eitoku's ancestors Masanobu, Motonobu, and Shōei had painted many fusuma, but none of them surpassed his work at Azuchi castle. Eitoku broadened and developed the style created by his grandfather Motonobu, making it more heroic, well suited to the military spirit of the age.

A few years later Eitoku was asked to work for Toyotomi Hideyoshi, and it is believed that he executed the paintings in Osaka castle (built 1583) and in the Jurakudai Mansion in Kyoto (built 1585). The *shoin* and Hiunkaku of the Nishi Honganji in Kyoto are said to have come from these two buildings.

Although the period during which Oda Nobunaga and Toyotomi Hideyoshi held political power was brief (1573–98), the two rulers succeeded in establishing a solid feudal regime. The age of Nobunaga and Hideyoshi was characterized by a heroic and luxurious culture, reflecting the life and spirit of these two rulers. Another of Hideyoshi's fortresses was Fushimi castle, erected on Momoyama in Kyoto, in 1594, which gives its name to the Momoyama period during which Nobunaga and Hideyoshi lived. The greatest representative of the art of the Momoyama period was Eitoku, whose pictorial style was followed also in the next period, the Edo.

Besides Shōei and Eitoku, many other members of the Kanō family contributed to the development of the Kanō school after the style of Eitoku. Among them were Yukinobu (d. 1575), younger brother of Motonobu; Munenobu (d. 1562), eldest son of Motonobu; Sōshū (d. 1601), younger brother of Eitoku; Mitsunobu (1565–1608), eldest son of Eitoku; and Takanobu (1571–1618), second son of Eitoku. Hideyori, who was a contemporary of Shōei, Motohide (d. 1601), Naganobu (1577–1654), Soyu (1566–1617), Naizen Shigesato (1570–1616), Sanraku (1559–1635), and others, since they bore the name of Kanō, must have come from the same family.

After Eitoku's death in 1590 his eldest son, Kanō Mitsunobu, worked for Hideyoshi. The paintings in Fushimi castle were by Mitsunobu, and he is supposed to have been assisted in this work by his uncle Sōshū, his younger brother Takanobu, his father's disciple Sanraku, and others. Mitsunobu and his disciples painted many fusuma for the mansions of the court nobles, for Nagoya castle (built 1612), for the residences of local daimios, and for various temples.

The extant authentic works of all these artists are not numerous. Among these the following are representative: *Ploughing*, 8 fusuma by Yukinobu, Daisenin of the Daitokuji, Kyoto; *Nehan* (*Parinirvāṇa*), by Shōei, Daitokuji, Kyoto; *Maple Viewing at Takao*, *byōbu* by Hideyori, National Museum, Tokyo; *Chinese Lions* (X, PL. 140), six-panel *byōbu* by Eitoku, Imperial Collection, Tokyo; 16 flowers and birds, fusuma (PL. 318), presumed to have been painted about 1566, and 12 landscapes, fusuma, all by Eitoku, Jūkōin of the Saitokuji, Kyoto; *In and Around Kyoto*, screen by Eitoku, Uesugi Takanori Collection, Yamagata prefecture; portrait of Oda Nobunaga, by Motohide (PL. 352), Chōkoji, Ōsato; *Hōkoku Festival*, screen by Naizen Shigesato, Hōkoku Shrine, Kyoto; *Feasting under Cherry Blossoms*, screen by Naganobu, National Museum, Tokyo; *Flowers and Birds*, fusuma by Mitsunobu, Kangakuin, Otsu; portrait of Emperor Goyōzei, by Takanobu, Senyūji, Kyoto; *Eagles and Pines*, screen by Sanraku, Nishamura Jurobei Collection, Shiga prefecture; and a figure painting, screen by Sanraku, National Museum, Tokyo.

The Kanō artists belonging to various branches of the family and their disciples were numerous and they dominated the world of painting during the Momoyama period.

KANŌ TANYŪ. Tokugawa Ieyasu came to power in 1603 and established his Bakufu (Shogunal Government) in Edo (mod. Tokyo). He remodeled the administrative systems and the institutions that Hideyoshi had established. The Tokugawa regime lasted until 1867, and the period from 1615 to 1867 is generally called the Edo period.

In 1590 Hideyoshi gave Kanto district to Ieyasu as his fief, and when the Bakufu was established in Edo in 1603, the city began to develop rapidly; it very soon became the cultural center of eastern Japan, just as Kyoto was of western Japan.

Among the painters invited by Ieyasu from Kyoto to decorate Edo castle were Kanō Mitsunobu, of the original Kanō family, and two painters of new branches of the same house, Naganobu and Yoshinobu (1552–1640). Mitsunobu returned to Kyoto on the completion of his commission, while Naganobu stayed on in Edo, the first of the Kanō family to settle in the new metropolis. As the Tokugawa regime became more firmly established, a need was felt for painters who would work exclusively for the government, and in 1621 an official-painter system was established. Kanō Sadanobu (1597–1623), the eldest son of Mitsunobu, was the head of the original Kanō family in Kyoto; Morinobu (Tanyū; 1602–74), the eldest son of Takanobu, was the head of a new branch of the house. When Tanyū was employed by Ieyasu as official painter, he transferred the headship of the house to his younger brother Naonobu (1607–50) and moved to Edo, where he was offered a residence near the Kajibashi Gate of Edo castle. For this reason Tanyū and his descendants are usually called the Kajibashi-Kanō. About 1630, when the number of the official painters in the service of the government was increased, Naonobu was sent for. His family later moved to Kobikichō and is usually referred to as the Kobikichō-Kanō. When Sadanobu, the head of the original Kanō family in Kyoto, died in 1623, Yasunobu (1613–85), the younger brother of Naonobu, inherited the house. Yasunobu also moved to Edo, before 1641, settling at Nakabashi, and this branch of the family is known as the Nakabashi-Kanō. Thus the Kanō school of Edo increased its power and influence, while the Kanō school in Kyoto declined.

Takanobu, the father of Tanyū and his teacher, died when his son was seventeen. In the absence of an expert artist to study under in the Kanō family in Kyoto, Kanō Kōi (1569–1636), one of the disciples of Mitsunobu, became Tanyū's guardian and teacher. Since Tanyū was employed by the Tokugawas as official painter at the age of nineteen, however, it is to be presumed that he studied under the guidance of Kanō Naganobu, who had been in Edo. His first great works were the paintings he did for Edo castle when it was reconstructed (1622). He became the most influential painter of his era. In 1638 he was given the ecclesiastical rank of *hokyō*, and this was when he changed his name from Morinobu to Tanyū; thus the works of art bearing the signature of Tanyū were produced after this date. He was promoted to the rank of *hōin* in 1662. Tanyū painted many works for the government, for the warriors employed by the government, and for the daimios who regularly came to Edo from their fiefs.

Tanyū paid three visits to Kyoto, in 1626, 1636, and 1641. On the third and last trip he was accompanied by his brothers Naonobu and Yasunobu. The first of the three journeys was made when he was ordered to decorate Nijō castle on the occasion of the interview between Emperor Gomizuno-o and the second shogun, Tokugawa Hidetada. The multicolored fusuma paintings on a gold ground, still in the *ninomaru* in Nijō castle, must have been done by Tanyū and his followers. During these three journeys he produced pictures, at the request of the imperial court, of various temples in Kyoto, and of the court nobles. The magnificent painted fusuma and screens that still survive in the Daitokuji, Chionin, Tokuzenji, Gyokurinin, Ryūkōin, Kohōan, Konchiin, and Nanzenji are believed to be by the hand of Tanyū himself. Some of the fusuma paintings in

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

Nagoya castle, attributed to Tanyū, must have been painted on one of this trips to Kyoto.

Tanyū's surviving works include, in addition to the large-scale fusuma paintings referred to above, scrolls such as the *Tōshōgū Engi*, an illustrated biography of Tokugawa Ieyasu in five rolls, produced in 1640 and kept in the Tōshōgū Shrine at Nikkō; portraits, including one of Ieyasu in the Rinnōji at Nikkō; and Buddhist paintings, such as the *Shaka Triad* in the Kōtōin at Kyoto. These works show that Tanyū was a versatile artist who could paint almost any subject in a variety of styles. A good many of his miniature paintings and sketch-books (Tokyo, Nat. Mus.) reveal that Tanyū improved his skill by his ardent and assiduous study both of nature (PLS. 353, 354) and of classical masterpieces. His genius is most evident in his larger works, in which he deftly expressed the spirit of the early Edo period.

Edo society was strictly feudal in structure, but Ieyasu's civil administration was based on Confucian philosophy and ethics. Tanyū reorientated the old Kanō school and adapted its style to the needs of a new society under a new regime. The features of the traditional Kanō school — magnificent design, bold lines, rich colors, less spiritual themes, and decorative emphasis — were replaced by a harmonious and gentle style; this new Kanō style expressed the Confucian spirit and conservative character of the regime. Tanyū was held in great esteem and promoted to the highest rank. He represents the academic school of painting in the Edo period.

THE EDO-KANŌ SCHOOL. The three masters of the Kanō family, Tanyū and his brothers Naonobu and Yasunobu, were appointed court artists in the service of the Tokugawa regime in 1621, 1630, and before 1641 respectively. The subsequent heads of the three Kanō families succeeded to the post until the Tokugawa regime fell in 1867. The three families are usually distinguished from one another by the names of the places in which they lived: Kajibashi-Kanō, Kobikichō-Kanō, and Nakabashi-Kanō.

Kanō Minenobu (1662–1708), the second son of Tsunenobu of the Kobikichō-Kanō, founded a new family and was also appointed court painter with the same rank as those of the three other Kanō houses. He lived at Hamachō, and his family for this reason came to be called the Hamachō-Kanō. Later on the branches of the four Kanō houses were also employed by the Tokugawa Bakufu as court artists of a lower rank; the four main branches were called *oku-eshi*, or senior court artists, to distinguish them from the lesser branches. The four *oku-eshi* on certain fixed days of the month worked in the office called the *o-e-beya* (painters' room) in Edo castle, where they painted, gave opinions on the classical paintings collected by the government, and restored paintings in the collections.

Several younger members of the four *oku-eshi* families and other disciples of superior skill — 15 in number altogether — were also employed as court artists. These 15 families, called *omote-eshi*, were on the same footing as warriors of lower rank.

The *oku-eshi* and the *omote-eshi* made up the Kanō school proper in Edo. In addition, there were hundreds of other Kanō painters who are considered part of this school. These minor artists were either distant relations or sons-in-law of the Kanō family or disciples granted the surname of Kanō; they were not in the service of the Tokugawa regime, but produced paintings in the Kanō style to satisfy the demands of the *chōnin* (townsfolk). These artists are generally known as Machi-Kanō. The three divisions are called the Edo-Kanō school to distinguish them from the Kanō school in Kyoto.

The painters of the Edo school generally followed the styles and techniques originated by Tanyū, the founder of this school, and no painter surpassed him. There were a few, however, who were nearly as good as Tanyū: Tanyū's brother Naonobu (1607–50), Naonobu's eldest son Tsunenobu (1636–1713), and Tanyū's adopted son Masunobu (Toun; 1625–94), for example.

In spite of his undeniable limits, Naonobu mastered the classical style through study of the simple and pure style of *sumi-e* painting. Among his extant works is a pair of landscape screens in Tokyo (PL. 355). Tsunenobu studied the classical works of art produced from the Muromachi period on. During his lifetime, the stable government and the rise of the wealthy classes made it possible for the ruling class to enjoy a life of peace and luxury. Tsunenobu emphasized the decorative elements of Tanyū's style and adjusted it even more to the spirit of the times (PL. 355). The Edo-Kanō school from then on followed Tsunenobu's style. Masunobu was an artist of outstanding skill whose designs and style were similar to those of Tsunenobu.

In this conservative age the Kanō painters found it safer to adhere to the styles and designs originated by Tanyū and Tsunenobu; the whole Kanō school in Edo had built up a little feudal society of its own, the center being the four *oku-eshi*. Some Kanō painters, however, departed from this conservative formalism and were expelled from the school; among them were Kusumi Morikage (ca. 1680), Hanabusa Itchō (1652–1724), and Tani Bunchō (1763–1842).

Morikage was a pupil of Tanyū, but being too eager to adopt the time-honored technique of *sumi-e* and to portray the life of the common people, he was not approved of by the Kanō school and he moved to Kanazawa. A good many of his works survive, including two screens: *Enjoying the Evening Cool* (Yoshida Shigeru Coll.) and *The Kamo Horse Race* (Tokyo, Ōkura Mus.). Itchō was at first a disciple of Yasunobu, but was expelled because he dealt with the life of ordinary citizens; the rest of his life was spent as a private painter. Bunchō also belonged to the Kanō school at the outset, but established a new style of his own, availing himself of the techniques and designs of other schools. In the eyes of the Kanō school he was a traitor, inordinately critical of their traditions.

THE KYŌ-KANŌ SCHOOL. Most of the Kanō families had moved from Kyoto to Edo before 1641. Among those painters who remained in Kyoto, Kanō Sansetsu (1589–1651), son-in-law of Kanō Sanraku, deserves special mention. Sansetsu was no less gifted than his father-in-law, and the Kanō school continued to flourish during his lifetime. Besides the *Plum Trees and Birds* fusuma in the Tenkyūin, Kyoto, which is now ascribed to Sansetsu rather than Sanraku, some *sumi-e* and large polychrome paintings survive, which testify to his mastery of the gorgeous decorative Momoyama style. After his death the Kanō school of Kyoto decayed rapidly, as the Kanō painters after Sansetsu were all mediocre.

The Kanō artists and painters who lived in Kyoto and followed the Kanō style are usually called the Kyō-Kanō school. The Kyō-Kanō school had their own traditions, uninfluenced by the Edo-Kanō school.

It was the employment of Kanō painters as court artists in the imperial court that gave the official seal of approval to the Kyō-Kanō school. From the Heian period on, the artists in the service of the imperial court had belonged to the Yamato-e school; since the Muromachi period artists of the Tosa family had succeeded to this position of honor. The custom changed, however, in the Genroku era (1688–1703), when, in addition to a Tosa painter, Kanō Tanzan (1655–1729) was appointed court artist. Tanzan, a disciple of Tanyū, moved from Edo to Kyoto, where his family was in the service of the court throughout this period.

Following the example set by the central government, many local daimios employed Kanō artists as their "court artists." Among these were Kanō Kōi, teacher of Tanyū and his brother, who was employed by the Tokugawas at Kishū (Wakayama prefecture), and various disciples of Tanyū who worked in other prefectures. This custom among the local daimios of employing Kanō painters helped to spread and popularize the school all over the country, so that by the middle of this period painting and the Kanō school were synonymous.

THE KANŌ SCHOOL AND MODERN JAPANESE PAINTING. The spread of the Kanō school in the Edo period was due not only to the patronage of the shogunate and the local daimios but also to the fact that the school had completely transformed itself into what might be called the art of the warrior class, fully adjusted to the tastes and needs of this class. However, other schools were active. The court nobles patronized the Tosa school, the

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

principal exponent of Yamato-e. In addition, the new importance of the *chōnin* gave rise to such schools as the Kōrin, the Maruyama, and the Ukiyo-e. Each school had its masters and masterpieces, but the Kanō school led in prestige.

When the Tokugawa shogunate was overthrown in 1867, ushering in the Meiji period, the warrior class collapsed and the Kanō school as a result declined rapidly. Only two representatives of the orthodox Kanō school remained in Tokyo: Kanō Hōgai (1828–88; PL. 356) and Hashimoto Gahō (1835–1908). In the Taisho period (1912–26) all the Kanō artists had disappeared, and their place was taken by the neo-Japanese school, founded in Kyoto and based on the Maruyama-Shijō school. Modern Japanese painting is a modification of the neo-Japanese school. The Kanō school is now extinct, and the few remaining traces may be discerned in the technique and the use of the brush in certain *sumi-e* works. Two masters who have conserved in their work this characteristic manner of the Kanō school are Yokoyama Taikan (1868–1958; PL. 330) and Kawai Gyokudō (1873–1957).

KASHMIR ART. Kashmir is situated in the western part of the Himalaya range (see INDIA), and its position as a frontier region is reflected in its art and culture. Basically Kashmir art falls within the orbit of Indian cultural and religious traditions, but actually it is the composite product of classic (see GANDHARA; KUSHAN ART), Iranian (see INDO-IRANIAN ART), Central Asian (see ASIA, CENTRAL), and, in a few cases, Chinese art. Grafted onto the traditional local forms, these external but, to a greater or lesser extent, dominating influences resulted in an original local idiom, exemplified in the monumental Kārkoṭa and elegant Utpāla styles.

SUMMARY. The development of ancient art in Kashmir (col. 961). The great phases of medieval Kashmir art (col. 965): *The Kārkoṭa style; The Utpāla style; The last phase.* The Islamic conquest and the later phases (col. 970).

THE DEVELOPMENT OF ANCIENT ART IN KASHMIR. Paleolithic points and flake blades, mainly of the Levallois type, were discovered by H. de Terra in the sediment terraces of the Sohan and Jhelum rivers and in Kashmir proper; they are the oldest discoveries in this region. At Burzahom near Harwan there is a megalithic circle consisting of a group of 11 megaliths, the only one in northwest India. There is one in Asota in Pakistan. Trial excavations have unearthed well-polished stone axes and painted gray (P.G.) ware beneath a later layer of northern black polished (N.B.P.) ware. On this evidence, which needs further corroboration, these megaliths have been dated about 1100–400 B.C. Cave paintings at Sassir Pass (Nubra Valley) may belong to the same period. Rock pictures (animals, hunting scenes) in Dardistan (Kargil and Kalatse), though still belonging to the same level of civilization, are, however, of a later period, as Brahmi and Kharoshthi inscriptions and pictures on Buddhist chortens prove.

Kashmir was part of the empire founded by the Maurya dynasty (324–181 B.C.). Srinagar, the capital of Kashmir, was founded under the name of Srinagari by Aśoka (r. ca. 273–ca. 236 B.C.) at what is now Pandrethan. When the capital was transferred to Pravapura (Old Srinagar) about 460, the original location was called Puranadhishthana, the "old capital." After the third Buddhist council at Palatiputra (mod. Patna), Aśoka sent Buddhist missionaries to Srinagar and erected the first stupa there, of which no traces are left.

To Jalauka, one of Aśoka's sons, is attributed the founding of the most famous Śiva temples: Jyeṣṭharudra or Jyeṣṭheśa behind the former maharaja palace at Gupkar, Vijayeśvara or Aśokeśvara at Bijbehara (anc. Vijabror), and Jyeṣṭharudra at Wangath. Jalauka's mother is said to have founded several Mātṛcakra (round temples of the "Mothers"). These temples were later rebuilt several times on a more magnificent scale. The huge Mātṛkā images found at Gupkar (now in Srinagar, Sri Pratap Singh Mus.) may go back to an 8th-century rebuilding of one of these Mātṛcakra.

The history of the subsequent centuries, the so-called "first Gonandiya dynasty," is obscure; as presented in Kalhaṇa's *Rājataraṅgiṇī*, written in the 12th century, it is a hotchpotch of disarranged historical facts, legends, and romances. However, we know from other sources that the Turuṣka kings Kaniṣka, Juṣka, and Huviṣka were the most prominent rulers of the Kushan empire, which from the end of the 1st century to the middle of the 3d century comprised Afghanistan, large parts of western and eastern Turkistan, and northern India up to Bihar, Gujarat, and Sind (see KUSHAN ART). Kaniṣka held a Buddhist council in Kashmir, which is mentioned by all Mahayana scriptures and historians as being of decisive dogmatic importance. Kaniṣka founded Kanishkapura (mod. Kanispor), his successor Juṣka (Vāsiṣka or Vajhiṣka) founded Jushkapura (mod. Zukur), and Huviṣka founded Huvishkapura (mod. Ushkur). Only Huvishkapura became a town of importance; its Buddhist monasteries were grouped around the great stupa erected by the emperor. In the 8th century it was filled with Hindu temples and was the residential suburb of the famous Viṣṇu temple dedicated to Varāha. (The cult became popular in the 6th cent.) Huviṣka's stupa was almost entirely rebuilt in the 8th century, but only the foundations remain. Contemporary Gandhara reliefs have not been discovered. However, the fragment of a statue of a Kushan emperor (Srinagar, Sri Pratap Singh Mus.) is reminiscent of the statues in Parthian style found in the chapel (*devakūla*) of the Kushans at Mat near Mathura, especially that of Huviṣka (see VI, cols. 29–30). But, as with a number of Gandhara statues, the emperor is represented in the guise of a god (probably the Buddhist yaksha Pāñcika) wearing a flower garland (*vanamālā*) and sitting on a crouching lion on a lotus socle.

Almost all the sculpture or fragments of sculpture in the Gandharan style found in Kashmir belong to the final phase of this artistic current, which received new impetus and new energy from the work of Parthian and Hellenistic artists, who moved to northwest India following the collapse of the Parthian empire in 227, and from a revival of the national Iranian art, which resumed, to some degree, the Achaemenian traditions (see SASSANIAN ART).

Shortly after this the Kushan empire was conquered by the Sassanians, but was restored a century later by the Kidaras after a period of struggle, during which time apparently the "second Gonandiya dynasty" came into power in Kashmir (ca. 345). Although this dynasty was soon the vassal alternately of the Kidaras, the Gupta emperors of India, the Ephthalites (White Huns), and the Maukharis (or Guptas of Malwa), it became the focal point of a local art tradition in which purely Parthian elements were fused with Hellenistic-Gandharan and Indo-Gupta elements.

The Parthian style proper is represented by the ruins of the Buddhist monastery at Harwan (anc. Shadarhadvana). Of the badly constructed stupas, apsidal chaitya hall, and cells for monks only the foundations survive. The floor of the court was covered with molded tiles decorated with bas-reliefs (PL. 359): Parthian horseman, heads, busts, and full figures of people in Indian costume (interpreted, though, in an utterly un-Indian manner), Brahmanical ascetics, wreath-bearing Erotes, stupas, floral ornaments, etc. The stupas depicted (probably of the same type as those once standing at Harwan) have a rather small body (*aṇḍa*), crowned by a set of honorary umbrellas surrounded by flags. The floral ornaments and other decorations are rem-

Principal centers of historic and artistic interest of Kashmir.

iniscent of those discovered at Mirpur Khas in Sind and Samlaji in Gujarat; they have a certain affinity with early Gupta art, but are probably prototypes of this rather than works of direct Gupta influence. The monastery had been founded by the Kushans, but the floor tiles are of the 4th century. Terra-cotta fragments of a related type have also been discovered at Pandrethan (now in Srinagar, Sri Pratap Singh Mus.).

The late Gandharan-Hellenistic figure style, as we know it from the stucco figurines of Hadda in Afghanistan and Jaulian and Mohra Moradu at Taxila, is represented by terra-cotta heads and fragments of figures from Ushkur and Akhnur. Those from Ushkur, of the same time as the Hadda finds, must have been executed on the occasion of the renovation of the Jayendra Vihara during the reign of Pravārasena I (ca. 379–ca. 410). The Akhnur terra cottas represent a later, "baroque" style, with round faces and rather heavy features, with a tendency toward formal mannerism (the first stage of the style development later found in the Tarim Basin; see ASIA, CENTRAL), very far from the fragile rococo elegance of the Fondukistan stuccoes (see INDO-IRANIAN ART). They may be of the time of Rāṇāditya (ca. 506–86). Probably belonging to the same era is a bronze Buddha in Srinagar (Sri Pratap Singh Mus.), of a decadent style but very well executed. Even later are the stone images of Hindu deities (Śrī-Lakṣmī, Gaja-Lakṣmī, and perhaps also Kārttikeya) and a number of stucco figures in a very decadent style from Bijbehara, also in Srinagar (Sri Pratap Singh Mus.), which are mostly of late Gandharan type but with some Gupta elements. It is tempting to connect these sculptures with a renovation of the Śiva temple of Vijayeśvara at Bijbehara when the Ephthalite king Mihiragula, a fanatical persecutor of the Buddhists and champion of the Hindu religion, settled Brahmans from Gandhara in the city about 520–30.

Gupta influence set in under Pravārasena II (ca. 410–70), who in his early reign seems to have been the ward of the great Candragupta II (see GUPTA, SCHOOL OF). After the first Tungus invasion the new capital Pravarapura was founded (ca. 460); this is now Old Srinagar. The city was destroyed and rebuilt many times, and the stones of the earlier buildings were used to strengthen the river dams. Though the sites of Pravārasena II's Pravāreśvara temple (today cemetery of Bahā-ud-Dīn) and of

Rāṇāditya's Rāṇāsvāmin temple (now cemetery of Pīr Hājj Muḥammad Sahib) have been identified, the ruins there belong to renovations of the 8th century.

THE GREAT PHASES OF MEDIEVAL KASHMIR ART. *The Kārkoṭa style.* The last Gonandiyas were reduced to utter impotence as a result of the Hun occupation. In 622 they were overthrown by Durlabhavardhana, the founder of the Kārkoṭa dynasty; under this dynasty Kashmir became one of the great powers of India. Originally probably supported by Harṣavardhana of Thanesar (606–47), the Kārkoṭas conquered the Punjab and the western Himalaya after the fall of Harṣavardhana's empire. Early in the 8th century they became the suzerains of the Turkish Śāhīs of Afghanistan, who were hard pressed by the Moslems. In 713 and 720 the Kārkoṭas appealed to the T'ang emperors for aid against the Moslem advance from Sind into the southern Punjab and reorganized their army and administration with the help of experts sent from China. Lalitāditya Muktāpīḍa (ca. 725–56) conquered India from the Bay of Bengal to Mysore, Ladakh, and a good part of the Tarim Basin but clashed with the rising power of the kings of Tibet and at last committed suicide in the snows of Central Asia. Jayāpīḍā (ca. 768–99) attempted to hold northern India, but failed. Under the last Kārkoṭas, tools in the hands of unscrupulous court factions, the kingdom was again reduced to the Jhelum Valley.

The war booty and an immense labor force were at Lalitāditya's disposal, and he engaged in a megalomaniac building activity. In this short period most Buddist and Hindu monuments in Kashmir, as well as a number of temples in the Punjab and even in Afghanistan, were erected, and these represent but a fraction of those mentioned in Kalhaṇa's *Rājataraṅgiṇī*. For almost half a millennium the later Hindu kings of Kashmir looted these temples and monasteries, especially of their costly images (some of gigantic size), to fill their depleted treasury. They also pulled down many temples and towns of this period to obtain cheap building materials. Later the Moslem sultans, especially Sikandar Būtshikān (the "idol breaker," ca. 1390–1416), the Moghul emperors, and the Afghans systematically destroyed many more temples. Even so, the largest and most impressive temple ruins, indeed the overwhelming majority of those surviving, belong to the reign of Lalitāditya.

Of the early monuments of the Kārkoṭa dynasty, when Pravarapura (now completely destroyed) was still the capital, we know hardly anything. Possibly the Śaṅkarācārya (Jyeṣṭheśa) temple proper on the Takht-i-Sulaymān may date from this time, for this perplexing monument is an almost fully developed shikhara of the central Indian type (and therefore cannot be older than the 7th cent.) but of very crude workmanship, with triangular gables that appear to be a transition from the Indian *upaśṛṅga*. It stands in complete contrast to the simple but perfect Gupta platform and to the octagonal exterior platform with its arcaded balustrade and staircase that was evidently constructed during Lalitāditya's reign around the original sanctuary.

The temples of Ladhu (Loduv), 6 miles from Pampur, and Norwa also look rather archaic. Ladhu is probably identical with Lalitapura, which was founded by one of Lalitāditya's architects. The temple, with its horseshoe arch entrance, simple torus course at the base, cornice, and domed round cella, is perhaps an example of the still undeveloped early Lalitāditya style. It may be of approximately the same time as the platforms of the Jyeṣṭheśa temple on the Takht-i-Sulaymān and the ruins in the Zainakadal quarter of Srinagar (which were reused for the cemetery of Pīr Ḥājj Muḥammad Sahib and the mausoleum of Sultan Zain-ul-'Ābidīn's mother), for here we find the same plinth moldings, the same round arch tending toward the horseshoe, and the same balustrade of small, round-arched niches. Dating from this period is a bronze Buddha (Berlin, Mus. für Völkerkunde), which is a clumsy attempt at transforming a Buddha of Gandharan type into a three-headed Viṣṇu.

The new artistic current set in with the monuments erected by Lalitāditya's Tocharian prime minister Caṅkuṇa, a fervent Buddhist originally in the Chinese service. The earliest ones seem to have been some small stupas of late Gupta type, decorated with Gupta Buddhas and with semi-Chinese bodhisattva statues whose style evokes associations with Wei, Six Dynasties, and T'ang prototypes. These were followed by the repair of Huviṣka's great stupa and monasteries at Huvishkapura. When Lalitāditya founded a new capital at Parihasapura (mod. Paraspor), Caṅkuṇa created a Buddhist establishment there, consisting of the Rāj Vihara (royal monastery), a chaitya, and a great stupa. The stupa, a copy of the one at Huvishkapura, has a double platform with a stairway on each side; the trefoil arches contained images of the Buddha, in a decadent Gupta style, and of bodhisattvas, inspired by T'ang Chinese prototypes. The chaitya was a towerlike building, open in front, in which a huge Buddha of embossed and gilded copper was surrounded by a gallery of several stories. A similar Bṛhadbuddha was erected by Caṅkuṇa at Pravarapura. Both were evidently inspired by the colossi of Bamian (PL. 10), and it is thus not surprising that Gandharan motifs were prominent in the decoration of the chaitya. Probably all these monuments were completed before Lalitāditya's conquest of India in 733–47.

In the next buildings two new tendencies appear: late Syro-Roman and Byzantine stylistic elements on the one hand and late Gupta (Kanauj and Bengal) on the other. The first (round arch and niches) become apparent in the Jyeṣṭheśa temple on the Takht-i-Sulaymān and the mausoleum of Sultan Zain-ul-'Ābidīn's mother, of later date. In the temple at Malot in the Salt Range both styles appear, unassimilated, side by side.

In the great Sun (Sūrya) Temple of Martand the Syro-Roman traits predominate (PLS. 360, 361). It is a tower construction with a rather short cult hall (mandapa), which stands on a platform and is flanked by two double chapels. Many details are Roman: use of mortar and dowels; genuine round arches (rarely used in India); a ceiling of superimposed intersecting squares; engaged Doric columns, Corithian pilasters with small rectangular panels and niches, helical columns; vast Syrian windows with heavy lintels; and Byzantine imposts, triangular panels (as at Mshattā) enclosing projecting heads, and harpies (*kinnaras*) in the corners of the gables. This type of temple had already developed in Gandhara and in the Gupta empire under Parthian and Roman influence. The capped and superimposed gables and trefoil arches were common in Gandhara. (At this time they also began to be used in the Mediterranean.) The column bases are Gupta, and their capitals represent that transitional stage from the Parthian (i.e., Gandharan-Hellenistic) acanthus capital to the Gupta pot-and-foliage capital, which we know from Mirpur Khas, Samlaji, and Bhitargaon. The sculpture is purely Indo-Gupta in style, although the costumes and jewelry are characteristic of northwest India (derived from the Gandharan tradition).

Although there had been some mixture of western and Indian artistic elements from about the 2d century, it appears that the immense artistic activity under Lalitāditya required more artists than were available locally, necessitating the importation both of Syrian architects, who were far superior to the Indians as engineers and who were unemployed after the conquest of Syria and the invasion of Asia Minor by the Arabs, and of Indo-Gupta masons and sculptors, whose work was superior to that of the westerners.

Roman influence is also evident in the ruins of the Hindu temples in Parihasapura. The other temples that can be attributed to Lalitāditya's time — Wangath, Pandrethan, Buniar, Naoshera, Narastan, and Amb (where Bengali features predominate) and Katas in the Salt Range — reveal a progressive simplification of the architectural forms and a parallel barbarization of the sculpture. These ruins are still impressive because of their size and the strength of their construction. Only a few stones remain of monuments in the following places: Wular Lake dams, Lokbavan, Fatehgarh, the Dhathamandir temple near Uri, and Firozpur-Drang, all in Kashmir; Saydabad, Panjmara, and Thana, in Bhimbar; Rajaori, Chatrarhi, and Brahmor, in Chamba; Bhavan in the Kangra Valley; Manali in Kulu; Maylang and Triloknath, in Lahul; Pasupatinatha (Yamunā statue) in Nepal; the Chomos of Dras on the route to Ladakh; the Swat Valley; and eastern Afghanistan. To

complete these architectural works in less than three decades it was necessary to employ insufficiently trained artisans. Thus most of these temples had very few sculptures. Also, in constructing the temples a few standardized forms were employed, such as the Gupta plinth, pseudo-Doric and pseudo-Corinthian columns and pilasters, trefoil arch under a steep gable, and double pyramidal roof; these are the typical elements of the medieval Kashmir style. The most grandiose, somewhat barbaric sculptures are those excavated during the construction of the maharaja's palace at Gupkar; they probably belonged to the Jyeṣṭheśa temple at Gupkar. The style of these statues, now in Srinagar (Sri Pratap Singh Mus.), is a mixture of Indian, Gandharan, and late Roman elements.

Jayāpīḍa founded his capital, Jayapura, on the Jhelum north of Srinagar; it consisted of the royal "palace which equaled heaven in beauty" (Abhyantarakotta), on an island in the Sambal swamp, and the town proper (Dvaravati, mod. Andarkoth), between the swamp and the river. The ruins of numerous temples can still be seen; although they are in very poor condition, they reveal a powerful but much more refined taste than in Lalitāditya's time. Of the monuments of the last decades of the Kārkoṭa dynasty, all that remain are some huge fragments of the foundations of the Padmasvāmin temple at Padmapura (mod. Pampur), built by the minister Padma, regent for King Ajītāpīḍa (ca. 812–50) in his childhood, and a temple ruin at Utpalapura (mod. Kakapur, between Pampur and Vantipur), built by another minister.

The Utpāla style. With the descendants of Utpāla, brother-in-law of the twelfth Kārkoṭa king Lalitāpīḍa, another strong dynasty came to the throne; they brought prosperity again to the country and restored the suzerainty of Kashmir over the western Punjab and eastern Afghanistan (then under the Hindu Śāhīs). King Avantivarman (856–83), who was principally responsible for this recovery, founded Avantipur (mod. Vantipur). While still heir apparent he erected the Avantisvāmi temple (FIG. 967) dedicated to Viṣṇu, a copy on a smaller scale of the Martand temple. When he became the ruler, he built the Avantiśvara temple dedicated to Śiva; set on a broad platform with projecting chapels at the four corners, it is of the *pañcāyātana* type. The architectural forms are much more elegant than in Lalitāditya's time. The temples were richly decorated, and many of the ornaments were of Sassanian origin. The sculptures are better modeled than the earlier ones, though often very mannered; the idols possess a suppressed vitality (PL. 362; VII, PLS. 228, 463). The better reliefs (Viṣṇu with his consorts, the king, queen, high priests, etc.; PL. 363) are dignified; the others look somewhat bloated.

With Avantivarman's successor, the clever but cynical Śaṅkaravarman (883–902), another period of decadence set in. He was the first monarch to loot the earlier temples systematically. He demolished most of Parihasapura in order to build another capital, Sankarapura (mod. Patan), 3 miles further west. There were three principal temples in this city, but only ruins of the Śaṅkaragaurīśvara (built by the king; PL. 364) and the Sugandheśa (built by his queen Sugandhā) are left. In size the temple compares with those at Avantipur; the ornamentation is even more elegant, but the figural decoration is simpler. A bronze frame unearthed at Divsar (anc. Devasarasa in the southern Kashmir Valley; PL. 364) sheds a revealing light both on Śaṅkaravarman's policy and on the art encouraged by him. The frame, beautifully made, was designed for a Buddha image apparently belonging to one of Caṅkuṇa's buildings. In the frame is a series of figures representing the 10 avatars within flower scrolls, and at the top is a 4-headed Paravāsudeva (in Pāñcarātra theology); by this means the image was transformed into Viṣṇu's Buddha avatar. In other words, a Buddhist monastery had apparently been looted, but the sordid transaction was concealed by its official transformation into a Viṣṇu temple, with beautiful, but not especially precious, equipment. On this frame the king, his queens Sugandhā and Surendrāvatī, and two other persons, probably the minister Nāyaka and Sukharāja, are represented as donors. Its style is analogous to the Rashtrakuta cave sculptures at Ellora; its iconography anticipates much of later Tibetan Buddhist art. The 35 years after the assassination of Sugandhā in 904 were an uninterrupted series of debaucheries and murders; the throne was sold by the royal guards to the highest bidder; the provinces were fleeced and in revolt. During this period building activity was continued, but the constructions were mainly in wood.

The Utpāla dynasty left its mark on the art of the surrounding areas: in the north, at Navapura in Gilgit; in the southeastern Himalaya, with the lovely Kālī temple at Thalora-Babbaur and in Jammu with the Kāladhera, besides minor works of sculpture at Akhnur, Chamba, Mulkihar, Nagar in Kulu, Kangra, etc.; in the Punjab plains and North-West Frontier, with the temples at Bilot, Kafirkot, Sassi-da Kallar, and Baghanwala, in a mixed Pratīhāra-Kashmir style, as well as individual sculp-

969

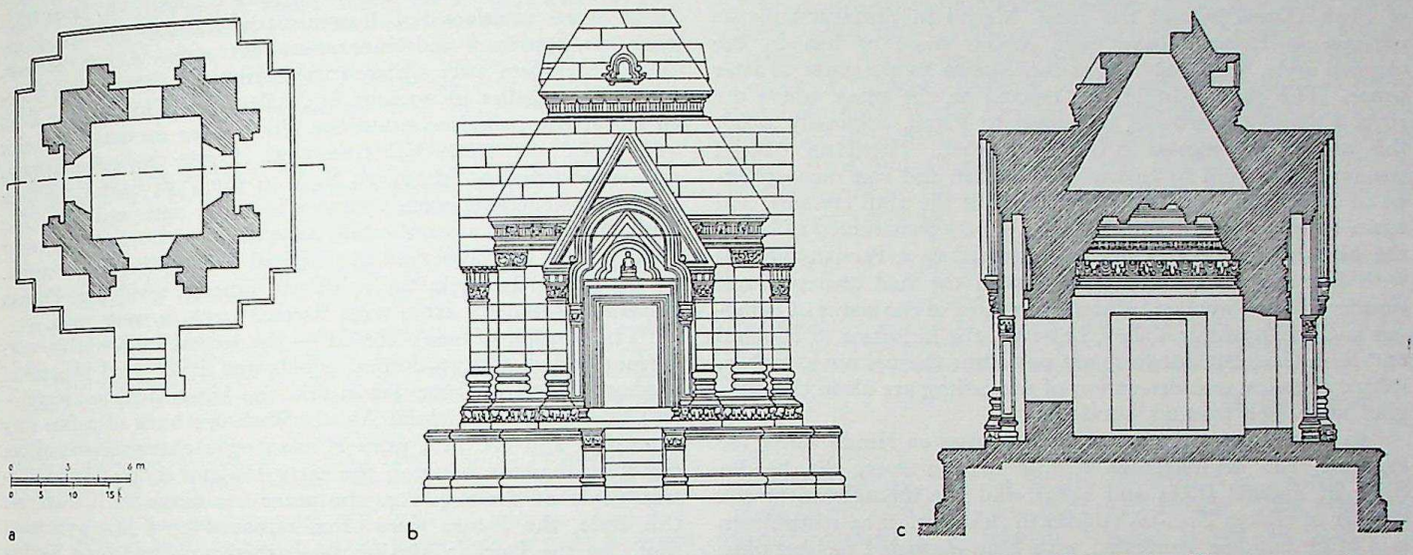
tures from the Yusufzai district (London, Br. Mus.), Peshawar, Kaithal, Hansi, and others of unknown origin (London, Br. Mus.) executed under the Hindu Śāhī kings, who were at first vassals of the Utpālas and later became independent.

The last phase. The final phase of medieval Kashmir art was the work of the Rajput princes of Lohara (in the mountains between Kashmir and the Punjab), first through Diddā (958–1003), queen of the weak Kṣemagupta (950–58), then through her nephew Saṅgrāmarāja (1003–28) and his descendants Ananta (1028–63), Kalaśa (1063–89), and Harṣa (1089–1101), and finally through the descendants of Diddā's brother Kāntirāja, Uchchala (1101–11), Sussala (1112–28), and Jayasiṃha (1128–55). Under the first Lohara kings Kashmir again became a power, at least in the Himalaya, although the ruling dynasty could not hinder the overthrow of the Hindu Śāhīs by the sultans of Ghazni. Art and culture flourished again. But under Harṣa's extravagant rule the long-festering social discontent erupted in a terrible revolution that weakened the royal power so much that the following rulers, although they were very capable, had great difficulty with the practically independent nobility. The subsequent Hindu dynasties were almost without power. The country again became impoverished, and there was no artistic activity worth mentioning.

The stone temples of this last period (Bumazuv, Pandrethan, Zadibal, Kother, Payar, Mamal, Naranthal, Garur) became smaller and smaller, and their forms, highly integrated, were increasingly simplified. The decoration, restricted to the socles, capitals, cornices, etc., made use of small figures, if any, and tended more and more toward filigree. The best known temple is the Rilhaneśvara, dedicated to Śiva, in Pandrethan (FIG. 969). Erected about 1135 by Rilhana, a minister of Jayasiṃha, it is similar to the Bhīmakeśava temple in Bumazuv, founded by Diddā's grandfather, Bhīma Śāhī (940–65), which is now the ziara of the Moslem saint Bābā Bamudīn Sahib, and also to the Hindu temple upon which the ziara of Mādīn Shah in the Zadibal quarter of Srinagar was erected. The Mameśvara was built by Jayasiṃha at Mamal, opposite Pahlgam. Kashmir influence spread outside the Jhelum Valley, as the temples in Nainsukh and Ballaur show.

In this period the wooden temple became much more important. Though all these monuments have been destroyed in Kashmir, the type seems to survive in the characteristic wooden mosques (blockhouses with a low pyramidal roof, enclosing a huge hall) and also in the monastic architecture of western Tibet. Examples of the interior decoration still exist in the Kālī (originally Sūrya) temple of Mirkula-Udaipur in Chamba (probably restored by Sūryamatī, Ananta's queen) and also in the carvings in the Buddhist temples of Tsaparang in Guge (western Tibet), Toling and Lha-lun in Spiti, and Alchi in Ladakh. Even more than in the stone structures, the colonnettes and screens were covered with fine filigree filled with figures set in complicated niches or resting on lotuses emerging from a rich scrollwork. The old royal palace of Srinagar at Rajadhani near the second bridge, 12 stories high and famous for its luxury, was built of wood and was destroyed by fire when Harṣa was besieged by the revolutionaries.

The sculpture of Diddā's time, known to us from a stone



Pandrethan, Rilhaneśvara temple dedicated to Śiva, 12th cent. (*a*) Plan; (*b*) elevation; (*c*) section (*from Kak, Ancient Monuments, 1933*).

Birth of the Buddha from Pandrethan (PL. 363) and a bronze Avalokiteśvara group (PL. 364), represents the decadent phase of the Utpāla style; the modeling is still careful but the proportions are bad, and the faces are soft, tired, and unhealthily bloated. This last characteristic was taken over by the Lamaistic art of Tibet, where the Buddhist reformers Rin-c'en bzaṅ-po and Atīśa summoned some hundreds of masters from Kashmir. The 11th-century style again became tense and energetic; examples are the idols from Verinag (now in Srinagar, Sri Pratap Singh Mus.), the reliefs at Mirkula-Udaipur in Chamba, and the two Buddha reliefs at Tabo in Spiti. Later the modeling and plasticity disappeared; the figures were no more than lifeless dolls, at first elegant but in the 13th century grotesque.

Painting of the 8th and 9th centuries is perhaps represented by the "late Gandharan" murals in the cave temples at Kizil and Ming-oi in eastern Turkistan (see ASIA, CENTRAL; KUCHA). Painting of the 10th and 11th centuries survives in the Tibetan murals in Man-nan and, in part, in Tsaparang, as well as in illustrated manuscripts from Toling and Kulu; their draftmanship is more delicate and lively than in the Pala paintings of Bengal, the colors are brighter, the halos iridescent, and the background sometimes golden. Shawl weaving was introduced from Central Asia by Suhadeva (1301–20).

THE ISLAMIC CONQUEST AND THE LATER PHASES. Islam was introduced in 1339, when the Moslem adventurer Shah Mīr, who was the powerful minister of the last Hindu queen Koṭā Devī, married and then assassinated her; he then took the title of Sultan Shams-ud-Dīn. The cultural transition was rather slow, mainly by conversion (chief missionary Shah Hāmādan, d. 1384). Only later, during the reign of Sultan Sikandar Būtshikān (ca. 1393–1416), at the instigation of the Moslem immigrants, were the Hindus systematically persecuted and their temples destroyed. His successor Zain-ul-'Ābidīn (1420–70) did much to restore harmony between Hindus and Moslems.

The early Islamic architecture of Kashmir was therefore an adaptation of the indigenous wooden style into which genuine Islamic forms penetrated only gradually. The characteristic

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

building was a huge blockhouse of square ground plan; the interior consisted of a hall of one or two floors, sometimes supported by four pillars; in other words, it was a variation of the type first known to us in Caṅkuṇa's chaitya at Parihasapura. Also characteristic of this style were the "storerooms" along the walls of the hall (originally cells of the Buddhist monks) and the slightly sloping turf roof with wooden "bells" suspended from the flower (originally dragon) decoration at the corners; in the center of the roof was a conical *ma'zīna* (low minaret), reminiscent of the *chattrāvalī* (shikara) of Buddhist stupas and Hindu temples. None of the original monuments still exist, because these wooden buildings caught fire easily. The ziara and mosque of Shah Hāmadān and the Jāmi' Masjid in Srinagar and the mosque in Pampur have been rebuilt more or less in the original style, with only slight concessions to the taste of later times. The Jāmi' Masjid was erected on the place where the royal Cakradhāra temple, dedicated to Viṣṇu, originally stood; this temple was moved to the Hariparbat. The Jāmi' Masjid was originally built by Sikandar Būtshikān and was reconstructed in 1503, 1620–37, 1674, at the end of the 18th century, and again in 1913. In the Jāmi' Masjid, partly constructed of brick, the blockhouse construction was adapted to a Persian mosque with four aiwans (vaulted halls), with the hall and peristyle resting on huge wooden columns. In most of the ziaras in Srinagar and the Kashmir Valley, however, the influence of Moghul and Sikh (i.e., late Moghul) art is visible; the columns, arches, mirror mosaics, and decoration of the ceiling are all in the Moghul style (see MOGHUL SCHOOL).

In several cases the ziaras were erected on Hindu ruins, for example, the Bhīmakeśava temple in Bumazuv, the Mādīn Shah in Zadibal (1444 and 1483), and the mausoleum of the mother of Sultan Zain-ul-'Ābidīn in Srinagar. The mausoleum is a brick building decorated with blue-enameled molded tiles, and is crowned by five fluted domes on drums; the ground plan is unusual and is based on the cruciform layout of the original Hindu temple of the early 8th century. Zain-ul-'Ābidīn was a great patron of the arts. He constructed the pleasure islands of Sonā Laṅkā and Rūpa Laṅkā in Dal Lake, Zaina Laṅkā in Wular Lake, and a network of irrigation canals nearby. When the sultan constructed the Zainakadal quarter of Srinagar he built six wooden bridges over the Jhelum, which were only recently modernized. He introduced from Timurid Samarkand most of the industries for which Kashmir has become famous: wood carving, lacquer, papier-mâché, etc. No buildings remain from the last years of the sultanate — a period of civil wars and of invasions.

The Moghul emperor Akbar (1556–1605) conquered Kashmir in 1585. When he visited the valley in 1589, he had a strong fortress constructed on the Hariparbat, which was completed in 1599. It was his successor Shah Jahāngīr (1605–27) who first appreciated the beauty of the country; he made it his imperial summer residence in 1619. A good road, provided with caravansaries (at Nur Mahal, Saydabad, Naushahra), was constructed over the Pir Panjal Pass. The Shālimār Bāgh on Dal Lake and the bathing pool at Verinag (source of the Jhelum) were erected in 1619/20, and the gardens at Achabal, Manasbal Lake, and Gandarbal were laid out during Jahāngīr's reign. The empress Nūr Jahān seems to have been especially fond of Kashmir; the Paṭṭhar Masjid in Srinagar was built on her orders in 1623 and the Jāmi' Masjid was reconstructed in 1620–37. Shah Jahān (1628–58) spent many summers in Kashmir, and the Chashma-i-Shāhī on Dal Lake was built by him in 1632/33. His minister Āṣaf Khan laid out the Nishāt Bāgh on Dal Lake in 1633. Prince Dārā Shikōh, viceroy of northwestern India, erected the Parī Mahal overlooking the lake in 1644 and a mosque for his former tutor Mullā Akhūn Shah on the slopes of the Hariparbat in 1649. After the new imperal residence at Shahjahanabad (Delhi) was completed in 1638 and the Tāj Mahal in Agra in 1648, Shah Jahān ceased visiting Kashmir regularly. And after Aurangzēb (1658–1707) the emperors came no more. The last genuine Moghul work was the decoration of the ziara of Shah Hāmadān during Aurangzēb's reign. However, the frequent imperial visits had made Srinagar an important artistic and industrial center, and the city was particularly noted for the production of Kashmir (Cashmere) shawls.

All the Moghul gardens (see LANDSCAPE ARCHITECTURE; MOGHUL SCHOOL) were laid out in terraces, each one corresponding to a palace section: the first terrace, sometimes touching the lake, for general receptions; the next one for the men; the last one for the women. Some gardens (e.g., at Achabal and Verinag) were on a single level; others rose in terraces, with the highest reserved for the women, who were able to enjoy the view without being seen. Along the central axis of the garden ran a channel interspersed with basins and fountains; the water fell in front of colored lamps and ran along ramps decorated with fish scales (*pusht-i-māhī*), creating waves; across the channel were bridges with pavilions and platforms of various shapes. On both sides there were multicolored flower beds watered by secondary channels, cypresses and chinars, and orchards. Along the walls of the enclosure were situated the hammams (hot baths), quarters for the ladies in waiting, etc. Most of the inhabitants lived in tents; the principal buildings alone were executed in brick and wood on stone substructures. Only the substructures and some brick buildings go back to the 17th century; all the other constructions were renovated in the 19th century. The Parī Mahal, high up on a hill, now deserted because the water supply dried up, preserved the original Moghul brick structures. In the Shālimār Bāgh, the principal imperial residence, Persian columns of black marble with Rajput brackets were used.

The Paṭṭhar (Stone) Masjid — the largest in Kashmir, with 9 front arches and 27 domes, which was never used because of a quarrel between Nūr Jahān and the local Moslem clergy — and the mosque of Mullā Akhūn Shah are built of a fine gray limestone and are in a pure Persian style characteristic of the transitional phase between the early Moghul style and the classical style of Shah Jahān. In other buildings in Kashmir in this style, the domes were often replaced by a low pyramidal roof. In the Paṭṭhar Masjid the cusped arch was used for the first time. The much-renovated mosque of Hazratbal on Dal Lake, built by Shah Jahān for a hair of the Prophet, followed the traditional local design but was of Persian construction. The stay of the emperors in Kashmir also influenced Moghul art. Copies of the Shālimār Bāgh were executed in Delhi (1632) and Lahore (1637; PL. 446), and the flower patterns of Kashmir became the favorite decoration of panels on palaces, textiles, weapons, etc.

In 1739 Kashmir passed into the control of the Persian Nādir Shah, and in 1752–53 it was ceded, together with the Punjab, to Aḥmad Shāh Durrānī. The Afghans exploited the country. However, they erected most of the present fort on the Hariparbat, built the Shēr Garḥī in Srinagar, repaired the Jāmi' Masjid and a number of ziaras, and decorated the entrance to the shrine of Mādīn with encaustic tiles, most of which have disappeared. The Parī Mahal was repaired by Malik Sābir Munshī, assistant to the cruel governor Āzād Khān Pathān, in 1784–85. The Afghans introduced a new style of Moghul-Persian painting (which originated in Persia) and new techniques for papier-mâché and lacquer; flower designs derived from Persian art were woven into the shawls.

Under Sikh rule (1819–46) the Jāmi' Masjid was closed and the central dome was removed from the Paṭṭhar Masjid. However, it was also during this time that textile arts flourished and Kashmir shawls were exported in large quantities to Europe and America. Illustrated Persian manuscripts found a market in Delhi and beyond. Under the Ḍogrā maharajas of Jammu, expecially under Gulāb Siṅgh and Ranbīr Siṅgh, Kashmir began to recover. In the Shēr Garḥi a summer palace in European style was built. All the Moghul gardens were renovated, and the present flimsy, but charming, buildings date from this time. The art of this period was a synthesis of Indo-Afghan, Sikh, and Kangra-Rajput elements. The Kangra style of painting was introduced from Jammu, from which the late Hindu-Kashmir miniatures developed. Generally 1 1/2 to 2 3/4 inches in size and depicting Tantric figures in vermilion and gold, these miniatures are found in numerous manuscripts, usually small, and in scrolls. The textile industry continued to flourish, as did lacquer work and wood carving. As a result of the annexation of Ladakh, art objects from China were diffused in Kashmir; the Chinese influence is mainly seen in wood carving.

Kashmir painting is no longer practiced, except in painted lacquer ware, and the Kashmir shawl has become an antique. Traditional wooden architecture is still being produced, although it has been adapted to the modern taste.

KENT, WILLIAM. English architect, landscape gardener, and painter (b. Bridlington, Yorkshire, probably 1685; d. London, 1748). It is said that he was first apprenticed to a coach painter. In 1709 he was sent by three patrons to Rome, where he collected works of art for their country houses and studied painting under Benedetto Luti. In 1719 he returned to England with Richard Boyle, third Earl of Burlington, whom he had met in Rome in the winter of 1714–15 and who lodged Kent in his own house in Piccadilly, where the artist completed Sebastiano Ricci's Cupid and Psyche cycle. Burlington obtained for Kent a commission to decorate the interiors at Kensington Palace (1722–25), and in 1726, through Burlington's influence, the artist became Master Carpenter of the King's Works. About 1725 Kent designed the interiors of Burlington's house at Chiswick, Middlesex (VI, PL. 441). In 1735 he was appointed Master Mason and Deputy Surveyor of the King's Works.

Kent's chief public buildings in London were the Royal Mews (1732, demolished 1830; Charing Cross), the Treasury (1734; Whitehall), and the Horse Guards (built 1750–58, after his death; Whitehall). His private works included Houghton Hall (Norfolk; VI, PL. 442), Devonshire House (1734, demolished 1924–25; Piccadilly), Holkham Hall (1734; Norfolk), 44 Berkeley Square (1742; London), Worcester Lodge and Badminton House (before 1745; Gloucestershire), and Wakefield Lodge (ca. 1748; Northamptonshire). Among his unexecuted designs for major public buildings were those drawn for new houses of Parliament. In his architecture Kent enlivened the austere classicism of Burlington with baroque touches and essentially painterly effects of massing and texture. At Esher Place (ca. 1730; Surrey) he was responsible for the earliest English example of Gothic rococo.

In garden design he was the leader of the landscape school, which substituted for the symmetry of the baroque a studied informality, which was justified by the Earl of Shaftesbury's concept of "nature's genuine order" and was thought to represent "the taste of the ancients." Gardens designed by Kent, wholly or in part, included Burlington's, at Chiswick; those at Esher Place and Claremont, Surrey; Euston, Suffolk; Stowe, Buckinghamshire (PL. 444); and Rousham, Oxfordshire, which is the best preserved.

KHMER ART. The art that flourished in ancient Cambodia (q.v.) from the end of the 6th to the end of the 14th century is designated as Khmer. Though it was an offshoot of Indian art (q.v.), the distinctive qualities of the Khmer people and the wealth at the disposal of their rulers during the period in which they dominated the Indochinese peninsula combined to give their art a highly individual cast. An account of the political factors that determined the several changes of capital and the contingent division of the country's history into successive periods is to be found in the article devoted to Cambodia, along with a description of the principal monuments found within the confines of modern Cambodia. The present article deals with the chronology and development of Khmer art, the various styles of which are named after the sites or monuments most characteristic of each. Architecture and sculpture will be treated jointly, not only because in function they were closely interdependent but also because subjection to the same currents of influence produced a parallel evolution.

SUMMARY. History of the research relating to Khmer art (col. 974). Chronology of Khmer art (col. 975). Building techniques, materials, and ground plans (col. 976). Pre-Angkorian art (col. 977): *Funan; Sambor–Prei Kuk; Prei Khmeng and Kompong Prah.* Styles of Angkorian art, first phase (col. 979): *Kulên; Prah Kô; Bakheng; Koh Ker; Banteay Srei; The Kleangs.* Styles of Angkorian art, second phase (col. 983): *The Baphuon; Angkor Wat; The Bayon.* Main trends in the development of Khmer art (col. 988). Minor arts (col. 991).

HISTORY OF THE RESEARCH RELATING TO KHMER ART. Khmer art has been the object of copious study ever since its imposing monuments were first drawn to public attention by Henri Mouhot, who had visited the ruins of Angkor in 1860. The work of the Commission d'Exploration du Mékong (1866–68), led by Doudart de Lagrée and Francis Garnier, and the Delaporte mission (1871–77) constituted a first phase of research, which resulted in the drawing up of a list of the principal monuments and the founding of a collection of Khmer antiquities in Paris.

A second phase was introduced with the work of Etienne Aymonier, who, as representative of the French protectorate in Cambodia, spent the years 1879–84 journeying about the country to make an inventory of its ancient monuments. The 340 impressions of Sanskrit and Khmer inscriptions he subsequently took back to France enabled the Sanskrit specialists Auguste

Barth and Abel Bergaigne to establish, between 1882 and 1885, a chronology of the Khmer rulers and to distinguish the characteristics of the ancient civilization of Cambodia. Etienne Aymonier's work *Le Cambodge*, published in three volumes between 1900 and 1904, presents the sum of what was known of Khmer art up to the founding of the Ecole Française d'Extrême-Orient.

The first task of this institute, whose creation in 1898 marked the beginning of a third phase of research, was to catalogue and describe the ancient monuments of French Indochina. Upon Siam's restitution of the ancient Cambodian provinces of Siem Reap and Battambang to Cambodia (treaty of March 23, 1907), the Ecole set up the Conservation d'Angkor, whose first duty was to free the most important monuments, Angkor Wat and the Bayon, of the jungle that had overgrown them. This body subsequently extended its work to other monuments, not attempting to restore them but merely seeking to halt the slow disintegration of the ruins. Since 1931, however, new methods of anastylosis, or reconstruction from scattered parts, based on those which the Archaeological Service of the Netherlands Indies was following in Java, have been applied wherever possible.

CHRONOLOGY OF KHMER ART. It is essential that study of Khmer art and of the various stages in its development be preceded by a brief account of the vicissitudes which have attended the chronological ordering of its monuments, for the chronology adopted in works on Khmer art written before 1929 is likely to be completely erroneous.

Until 1923 it had been accepted unquestionably that the Bayon and the enclosure of Angkor Thom were initiated by King Yaśovarman (889–900). Epigraphical evidence had revealed that he had founded a capital, Yaśodharapura, in the middle of which, according to a text of the 11th century, he had raised the "central mount." Since this city was firmly believed to correspond to the known Angkor Thom, the identification of the "central mount" with the Bayon temple, which stands in the exact center of Angkor Thom, seemed unavoidable. In 1924, however, the discovery of an effigy of the Bodhisattva Lokeśvara (Avalokiteśvara) carved on a pediment of the Bayon showed that this and other monuments of the same style (e.g., Banteay Kedei, Ta Prohm, Prah Khan, Banteay Chmar) had originally been Buddhist shrines, whose Buddhist decoration had subsequently been erased and replaced by a profusion of Saiva motifs. Since this group of monuments could therefore no longer be attributed to the time of the Saiva ruler Yaśovarman, Louis Finot, in the belief that there were valid grounds for assuming that King Jayavarman II (802–50) was a Buddhist, suggested attributing this monumental ensemble to his reign. This hypothesis — which, for legion historical and stylistic reasons, was in any case untenable — had scarcely been proposed when Philippe Stern put forward another, based on analysis of the decoration on the monuments, primarily because its development was perceptibly more rapid than that of either their ground plans or their structure.

Applying his method to the study of Khmer art, Stern (1927) succeeded in demonstrating not only the impossibility, stylistically, of assigning the Bayon to the same period as the brick towers of the 9th century but also the necessity of recognizing that the Angkor monuments belonged to two different periods and of attributing the Bayon and Angkor Wat to the second. King Yaśovarman had indeed founded a new capital, Yaśodharapura, and had raised a temple at its center, but the mistake had been to associate this capital of the late 9th century with the ruins of Angkor Thom as they are today. Stern deserves great credit for having refuted this long-accepted identification; but he did not go so far as to challenge the prevalent belief in the anteriority of the Bayon to Angkor Wat, which he continued to regard as the last great monument of Khmer art. Then, because of the Bodhisattva discovery of 1924, indicating that the decoration of the Bayon had originally been of Buddhist inspiration, he proceeded to search for a Buddhist ruler in the second half of the Angkorian era, and it was thus that he came to attribute the building of the Bayon to Sūryavarman I, who reigned during the first half of the 11th century and posthumously received the Buddhist name of Nirvāṇāpada. This dating merely complicated matters further; subsequent study (Cœdès) of the Sanskrit inscriptions on the steles at each of the four corners of the enclosure of Angkor Thom showed that they commemorated both the building of this enclosure and the digging of the moats around the city by King Jayavarman VII (last twenty years of the 12th, first twenty years of the 13th century). Citing the fact that the ringwalls and reservoirs of the city of Angkor Thom are inseparable from and form the enclosure of its central temple, the Bayon, the author proposed a chronology (adopted in 1929) which ascribed the building of Angkor Thom, the Bayon, and other monuments of the same style to the late 12th century and accordingly attributed their realization to the great Buddhist ruler Jayavarman VII. Thereafter, the site of the first Yaśodharapura, built by Yaśovarman at the end of the 9th century, and the identification of its "central mount" with Phnom Bakheng were established by Victor Goloubew (1931–32).

BUILDING TECHNIQUES, MATERIALS, AND GROUND PLANS. The Cambodian climate has destroyed all the lightweight wooden structures of the Khmers and has spared only the edifices built of durable materials, which were reserved exclusively for the gods and the deified dead. Thus, almost nothing is, or can be, known of their secular architecture and their houses, apart from what little can be learned through study of the relief carvings in which these are represented. The durable building materials of the Khmers were brick, laterite, and sandstone, used either in combination or separately. Sparse fragments of the wooden roofing of minor buildings have been found, together with odd bits of iron shaped like double T's and used as cramps.

Brick had been used almost exclusively for the tower sanctuaries from the 7th century to the 9th, after which it gradually fell into disuse; and even from earliest times the door frames had always been fashioned of schistose stone, and the architraves and colonnettes of sandstone. The bricks were smoothed by friction — one was rubbed against another — and then they were cemented together with a substance which ensured so perfect an adhesion that the blocks thus constructed could be carved like stone. Laterite, a reddish oxide of iron, which subsists in large quantities in the Cambodian soil, was used for foundations, annexes, enclosures, and the substructure of pyramids. Sandstone, which was quarried from Phnom Kulên, about 25 miles north of Angkor, is usually rather soft and tends to crumble in the process of extraction. Assembled without any adhesive substance, the blocks were smoothed, as they were laid, by means of an apparatus that is represented in a relief carving of the Bayon. The fabrication of these sandstone blocks had become very faulty by the time the Bayon was built, at the end of the 12th century; through haste or carelessness the masons neglected to alternate the vertical joints, a failure that accelerated the ruin of the structures. These edifices were raised on laterite foundations laid over a base of crushed stones. The solid structures, such as the stepped pyramids, were built of laterite and faced with sandstone.

Two features of the Khmer construction methods are noteworthy: first, since they did not know the principle of the keystone and used the corbeled vault instead, they could span only halls or galleries of limited width; second, they applied the methods of timber construction to stone architecture. According to Henri Parmentier, the second characteristic involved two illogical devices: fashioning stone blocks with the wood techniques of tongue-and-groove joints, slots, tenons, and mortises in order to hold them together and introducing wooden beams into the masonry. In the tropical climate the beams slowly disintegrated and finally crumbled to dust, leaving cavities that proved fatal to the stability of the walls.

In the decoration of the surfaces, the fundamental principle governing disposition of the stringcourse was symmetry, which dictated a harmonious balancing of the upper and lower moldings. The diversity of the moldings derived from their carved ornamentation.

This brief review of Khmer building techniques would be incomplete without passing mention of the "second thoughts,"

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

the revamping and the modifications carried out after a building had been completed, and sometimes even during its initial construction. It should also be noted that the builders did not hesitate to reuse elements salvaged from ancient monuments which had been demolished and that many buildings were never completed.

The typical ground plan of the temple evolved from very simple beginnings and became more complicated as time went on. Its essential element was the square or rectangular tower sanctuary, generally oriented toward the east and raised in three superimposed stages: podium, main structure, and superstructure, the latter composed of a varying number of nonfunctional stories, which were of decreasing height and constituted small-scale replicas of the main structure.

As in examples from the 10th century, the entrance to the tower was generally preceded by a porch; the door was set in a stone frame surmounted by an architrave that, supported on colonnettes, was in turn surmounted by a pediment. Blind doorways, of the same general design as the actual doorway, adorned the other sides (X, PL. 435), and the exterior decoration was completed by pilasters. The windows, framed in the same way as the doors, were spanned with more or less closely spaced stone bars or colonnettes in place of shutters. Because all the elements here enumerated were decorated, architectural decoration has proved of great value in the study of the development of Khmer art.

As noted earlier, all the monuments built of durable materials — the only ones that have survived — are of a religious character. The layout of the capital was determined by an intent to harmonize the world of men with that of the gods. Thus, the city that lodged the king, who was the supreme expression of the state, was designed as a replica of the universe. Square in plan, the city was surrounded by a water-filled moat, symbolizing the ocean, and was contained within a fortified wall representing the chain of mountains surrounding the world. The pyramidal temple that rose in its center constituted an embodiment of the cosmic mountain marking the center of the great world.

In the building program undertaken by the king, priority was given to hydraulic works for the benefit of agriculture (great reservoirs in the vicinity of the capital) and to other works of public utility (roads, inns, hospices). The second most important item was the raising of temples to accommodate the funerary cult of the royal ancestors and to display the deified images commemorating the deceased. It was only after he had fulfilled these social and familial obligations that the king could turn to the building of his pyramid, atop which was a cella to receive the image of the god-king and meant perhaps eventually to serve as the royal mausoleum. About ten such pyramid temples, built by as many kings, still exist: Bakong (881), Phnom Bakheng (end of 9th cent.), Baksei Chamkrong (beginning of 10th cent.), Koh Ker (921), the East Mebon (952), Prè Rup (961), Takeo and Phimeanakas (end of 10th, early 11th cent.), the Baphuon (third quarter of 11th cent.), Angkor Wat (first half of 12th cent.) and the Bayon (beginning of 13th cent.). In contrast to such permanent religious monuments, secular public buildings, royal palaces, and private houses were built of perishable materials and none survives.

PRE-ANGKORIAN ART. The oldest surviving examples of Khmer art appear to date from the 6th century, that is, from the last years of the Funan era. The art produced during the period that lasted from the Funan era until the end of the 8th century — known to history as the pre-Angkorian period — is quite distinct from Angkorian art, which developed about the beginning of the 9th century. This pre-Angkorian period comprises three different phases, named for the archaeological sites most characteristic of each: Funan, Sambor–Prei Kuk, and the phase of Prei Khmeng and Kompong Prah.

Funan (end of 6th, beginning of 7th cent.). It is not certain whether any of the monuments of southern Cambodia dates from the Funan era. However, it should be noted that for some time after the union of their country with Chenla at the beginning of the 7th century, the Funan kings continued to reign at Angkor Borei; therefore, a number of monuments and statues found in this region may well reflect the last phase of Funan art. Furthermore, according to a theory advanced by Parmentier, those edifices of the pre-Angkorian period with roofs comprising a large number of low stories of diminishing height and with niches reminiscent of the *kūḍu* of southern Indian architecture (see INDIAN ART) probably reproduce the characteristics of Funan architecture. Among the structures of this type is one of exceptional interest, the Asram Maharosei (see CAMBODIA), which belongs to the Angkor Borei group.

The statuary of Angkor Borei, which P. Dupont is inclined to attribute, if not directly to the Funan period, then at least to a school that was heir to its artistic traditions, includes both Hindu idols (see HINDUISM) and images of the Buddha (see BUDDHISM). Although some of these works already show a marked tendency toward the frontality that was to prevail in Khmer statuary, most of them remain faithful to the Indian canon of the triple flexion (*tribhaṅga*). The faces are flat, with elongated eyes and aquiline noses, and the hair is treated either in large flat curls or in long ringlets covering the nape of the neck. The only headdress represented is a cylindrical tiara; in general, jewelry is practically nonexistent. The statues of this period manifest the striving of the sculptor to realize statuary in the round through progressive liberation of the high-relief image or the engaged statue. Evidently, however, he was still not secure enough in his technique to disengage the statue completely, for it was provided with either a supporting frame or arm props, and sometimes even a stone wedge set between the ankles and terminating the front panel of its long garment.

The statues of the Funan phase, nearly all of which represent male figures, are of two different but not indisputably contemporaneous types. One class comprises figures dressed in a long garment similar to the Indian dhoti, with a sash round the waist; the other consists of figures of Vishnuite inspiration, of a homogeneous ethnic type (broad shoulders, narrow hips, and short legs), dressed in a short, pleated garment similar to the modern Cambodian *sampot*. The latter type — which includes the Vishnuite triad of Phnom Da, the Harihara of Asram Maharosei, and two images of Kṛṣṇa raising Mount Govardhana — would appear to date from the reign of Rudravarman (6th cent.), the last ruler of greater Funan before the incursions of Chenla.

Sambor–Prei Kuk (first half of 7th cent.). The three groups of edifices constituting the complex of Sambor–Prei Kuk correspond to the religious sector of the first capital of pre-Angkorian Cambodia, Iśānapura, built by King Iśānavarman in the first half of the 7th century. They comprise isolated or grouped (in a double quincunx in the northern group) brick towers of square plan, not unlike the ancient Cham towers, with a superstructure composed of a few stories of diminishing height that repeat the principal features of the main structure. The doorways have stone frames. Originally, the exterior walls were faced with decorated plaster, which has mostly flaked off and crumbled.

The decoration of the architrave was inspired by that of a wooden arch, adorned with garlands and pendants, whose jambs emerge from the jaws of affronted *makara*s supported on consoles. The arch is further ornamented with three medallions in high relief, the central one representing a divinity; below are garlands and pendants separated by small leaves. Infrequently, these foliate motifs adorning the space beneath the arch are replaced by figural scenes. The restrained decoration of the colonnettes consists of a ring with medallions around the middle, a frieze of pendent garlands around the top, and a row of leaves around the base.

Little is known of the decoration of the brick pediments, since it was executed in a layer of plaster which has not survived. From the little that remains of the tympanum decoration, it may be assumed that it consisted of a small-scale representation of an edifice. The frame of the pediment was generally in the form of an inverted U, while that of the small replicas of pediments on the upper stories was inspired

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

by the horseshoe frame, or *kūḍu*, of ancient Indian temples. The decoration of the blind doors, which were fashioned in brick and faced with a layer of plaster, constituted a detailed reproduction of a wooden door and its leaves. Although the pilaster decoration has almost all disappeared, the "flying palaces" represented in the interpilasters furnish some clue to the aspect of Khmer architecture in light materials.

The meager statuary of this period consists mainly of small, slightly inflected female figures, capped with cylindrical tiaras and dressed in skirts with the folds indicated merely by incisions rather than relief. With the male figures, the majority of which are framed in a supporting arch, the inflection steadily decreases as the tendency toward frontality becomes more pronounced. The most representative of the works in this style are a Harihara from Sambor–Prei Kuk, a Viṣṇu from Tuol Dai Buon, and a magnificent Lokeśvara found at Rachgia, in the delta of the Mekong. Sculpture in low relief is represented at Sambor by scenes carved on the lower part of some of the architraves and in the large circular medallions adorning the interpilasters in the enclosing wall of the southern group. The Indian influence manifest throughout probably dates from the first half of the 7th century.

Prei Khmeng and Kompong Prah (second half of 7th, and 8th cent.). To this period, besides the two temples for which it is named, belong the early parts of various monuments of the Roluos group (Svay Pream, Trapeang Phong) and of the Ak Yom pyramid, as well as Prasat Andet, which yielded one of the masterpieces of pre-Angkorian Khmer statuary, and the Phum Prasat, restored in 1928. The architecture of this period shows little change from that of the Sambor–Prei Kuk group. The only new development would seem to be the appearance of the pyramid at Ak Yom — provided, of course, that this pyramid is contemporary with the oldest parts of the monument.

The architraves are characterized by a profusion of foliate motifs that seems to cover their entire surface. The arch has become a heavy foliated scroll whose outward-coiling ends have replaced the *makara* of the preceding style; foliate motifs have also replaced the garlands and pendants. The decoration of colonnettes has become more elaborate: the leaves in the frieze of garlands round the top of the colonnette tend to supplant the garland itself, and clusters of blossoms embellish shafts, forming a series of rings. The pediments, blind doorways, and pilasters continue the Sambor decorative tradition, but representations of isolated figures on the walls perhaps reveal the Javanese influence that was to become pronounced in the following century (see INDONESIA; INDONESIAN CULTURES).

The statuary is somewhat uneven in quality; along with mediocre works that show no sense of either proportion or anatomy, the period produced a late masterpiece in the Harihara of Prasat Andet (PL. 365), in which both the modeling and the sense of anatomy are of exceptional quality. As was the case in the preceding period, inflection at the hips tends to be eliminated in favor of a more rigidly frontal pose. The headdress is still the cylindrical tiara, which curves over the temples and covers the nape of the neck to the apex of the spine. The short garment, draped in concentric folds and gathered into a bunch of supple pleats in front, foreshadows that of the following period. A small mustache appears over the upper lip for the first time and was long to remain one of the principal characteristics of the male faces. The scenes carved in low relief on a few of the architraves show little of the animation of the representations on the architraves of Sambor–Prei Kuk.

STYLES OF ANGKORIAN ART, FIRST PHASE. The Angkorian period, which opened at the beginning of the 9th century, lasted for five centuries; artistically, it falls into two phases. The art of the first phase, which came to an end early in the 11th century, is in turn divided into six different styles, linked by transitional styles: Kulên, Prah Kô, Bakheng, Koh Ker, Banteay Srei, and the style of the Kleangs.

Kulên (first half of 9th cent.). To this style belong not only the monuments of Phnom Kulên but also the main sanctuary of the central group at Sambor–Prei Kuk. As might have been expected, in view of the historical circumstances, this period was characterized by an artistic renascence, whose origins can be traced to the unmistakable influence of both Javanese and Cham art, even — though to a lesser degree — to that of the earliest forms of pre-Angkorian art. The pyramid of Rong Chen on the Kulên, an edifice of small height, undoubtedly dates from the reign of Jayavarman II.

Whereas the architecture of the tower sanctuaries differs but little from that of the preceding centuries, their decoration shows numerous innovations; and symmetrical grouping, hitherto an exceptional device, became the rule from this period.

The decoration of the architraves is greatly varied. The early arch reappears beside the foliate scroll of the Prei Khmeng and Kompong Prah style, its jambs sometimes springing from the jaws of affronted *makara*s, as at Sambor–Prei Kuk, and sometimes terminating in *makara* heads facing outward, as in Java. The medallions also reappear but are of a rather different aspect, and pendent leaves adorn the space beneath the arch. The colonnettes have assumed an entirely new form; their profiles, instead of being circular, are now octagonal or rectangular, and their shafts are expanded at summit and base. The moldings are evenly distributed along the shaft and, following a pattern that was to be observed until the 12th century, steadily decrease in size with their distance from the center. Each facet of the octagonal colonnettes is adorned at intervals with leaves represented in front view. The pediments of certain monuments are of a polylobed form. Many of the tympanums are in ruins; among those whose decoration can still be discerned, some were adorned with a solitary figure or a figure flanked by attendants, as at Champa, and others with representations of edifices, as in the pre-Angkorian period. The decoration of the blind doors and pilasters of the Kulên has worn away.

No female statues of the Kulên period are known. The modeling of the oldest images, such as the Viṣṇu of Rup Arak, remains fairly close to that of the Harihara of Prasat Andet, and the figures show a slight tendency toward plumpness. However, inflection at the hips is less and less noticeable, and the images have a hieratic attitude. The garment, sometimes turned down over a low belt at the top, is characterized by a sort of pocket on the right thigh and a mass of folds falling over the legs in front. The headdress is still the cylindrical tiara, but there also appear the first examples of the diadem that was to become the fashion in the ensuing periods; this is surmounted by a rather low, tiered miter of conical form and is still a very simple headpiece. The supporting arch, already greatly reduced during the preceding period, was definitively abandoned at the beginning of the Kulên period. The first images of crouching lions with huge heads and curled manes date from this period.

Prah Kô (last quarter of 9th cent.). A transitional period, represented by the central sanctuary of Trapeang Phong and two of the edifices of Prasat Kok Po (second half of 9th cent.), heralded the opening of the second period, which witnessed the building of the temples of the Roluos group: Prah Kô (ca. 879), Bakong (881), and Lolei (893).

The architecture of the brick towers presents no striking innovations in relation to that of the earlier towers. The six towers of Prah Kô and the four towers of Lolei are grouped on a terrace. The eight towers of Bakong rise at the foot of the first pyramid the Khmers built of stone. With its highly distinctive features, the decoration of these towers ranks among the most beautiful creations of Khmer art.

The architrave assumed in this period that aspect which, apart from changes of detail, it was to retain until the end of the Khmer period. The arch is represented as a horizontal, foliated scroll, rectilinear or undulating; its jambs are sometimes adorned with divergent *makara* or naga heads, sometimes simply with a plant motif, and beneath it hang large leaves twisted in the form of crosiers and interspersed with pendants. In the Prah Kô style, the central motif of the architrave, representing the head of the monster Kāla, a Garuḍa, or Indra, is set high (cf. VII, FIG. 924). The rectangular colonnette of the

UP State Museum, Lucknow

Kulên period does not persist in the Prah Kô style, in which, apart from an infrequent round colonnette, an extremely ornate octagonal colonnette predominates. The splay toward the summit and base is eliminated, together with the rings of molding, but pendants appear among the frontal leaves that decorate each facet.

Although most of the pediment frames are poorly preserved, it has been possible to establish that they were denticulated and that their edges were adorned with *makara* or naga heads. The tympanums were adorned with deities accompanied by worshipers, and these were framed within replicas of edifices which became more and more simplified. Stone slabs set into the walls flank the real and blind doorways and are carved with large figures. The pilasters are adorned with a variety of motifs, such as rinceaux, chevrons, foliate stalks, and lozenges, summarily executed in the brick and then detailed in a plaster facing. The plaster decoration still intact on the blind doors evidences a progressive increase in the number of moldings framing their leaves; this results in diminution of the central panel, which is adorned with a high-relief mascaron representing a lion's head.

The statuary, from which all props and supporting frames have been discarded, has assumed a hieratic severity. It is "standardized, almost codified, [and] already contains the seeds of all the formulas that were to be exploited for over three centuries" (J. Boisselier). The male figures, softly modeled without indication of musculature, continue to manifest a slight inflection at the hips and tend to be somewhat thickset. Treatment of the facial features is transitional between the preceding period and those to come: to the mustache is added a schematically indicated beard, and the eyebrows are joined in a slightly sinuous line that foreshadows the schematic horizontal ridge of the following century. A pleated garment is characteristic, and the top part of both the male garment and the female skirt is turned down over a belt to form a semicircular flap. The cylindrical tiara is replaced by a jeweled diadem, supporting either a narrow topknot or a tiered, conical miter (*mukuṭa*). The throat, torso, and arms are bedecked with jewelry.

New forms enriched the repertory of animal sculpture. In addition to the sedent lions with curled manes, there appeared some quite realistic crouching bulls and also some polycephalous nagas, displaying a tiny diadem on each head; the last-mentioned are represented slithering along the ground and form a balustrade on either side of the causeways.

Bakheng (end of 9th, beginning of 10th cent.). The Bakheng period, which marked the definitive establishment of the Khmer rulers at Yaśodharapura, on the site of Angkor, saw the development of stone construction. The three most important monuments of this period are the pyramid of Phnom Bakheng (PL. 368), located in the center of the capital; Phnom Krom, to the south; and Phnom Bok, to the east. All three structures are set atop natural eminences.

The Phnom Bakheng constitutes the first realization of the characteristic plan of the monumental edifices of Angkorian art: a stepped pyramid, with five towers disposed in quincunx on its uppermost terrace. The disposition of additional towers, as well as annexes and galleries, around this central structure varies from one monument to the next. The Bakheng pyramid has twelve turrents on each of its five terraces, and forty-four brick towers round its base.

The three massive stone towers of both Phnom Bok and Phnom Krom, oriented to the east and dedicated to the three gods of the Brahmanic Trimūrti, are aligned along a north–south axis on a single base. The plan of these stone towers is the same as that of the brick towers; they are composed of a base, a main structure, with real and blind doorways, and a tiered superstructure whose diminishing stories and setbacks repeat the form of the main structure.

The architraves are not so richly decorated as were those of the Prah Kô period. The foliated scroll dips in the middle, as if folding under the weight of the central motif (a *kāla* head or some other mythological subject), which has become more prominent. The octagonal colonnette continues the development of the preceding styles, and each facet of its shaft is adorned with frontal leaves flanked by two half leaves. The frames of the pediments, carved in stone, are of two different types: one is rather low and denticulated, the other higher and undulating. Both terminate in divergent *makara* heads, whose raised snouts hold pendants. The tympanums, though still adorned with a deity accompanied by lesser figures, begin to show the foliate motifs that were to become increasingly profuse in the subsequent styles. The leaves of the blind doors are no longer adorned with the protruding mascaron of the preceding period.

The statuary of the Bakheng period is the most hieratic of all Khmer sculpture. The human anatomy is completely stylized: there is no longer any trace of inflection at the hips; the faces are severe; the joined eyebrows form a sharp horizontal ridge across the forehead; the hair comes to a point at the temples; and the beard is indicated by a triangle pointing upward on the chin. Both the male and the female garments have narrow and uniform vertical pleats, and they are turned down over a low belt at the top. The headdress is a diadem, which sometimes supports a tiered, conical *mukuṭa* and sometimes a chignon either of horizontal tresses or of pendent ringlets. The sedent lions of the period are fairly naturalistic in proportion, but their manes gradually become stylized.

Koh Ker (second quarter of 10th cent.). After the transitional period represented by the Prasat Kravan (921), which is noted for the relief carvings adorning the interior, and by the small, laterite pyramid of Baksei Chamkrong (900–922), surmounted by a single sanctuary, the transfer of the capital to Chok Gargyar (Koh Ker) in 921 by Jayavarman IV inaugurated a new style characterized by a striving for grandeur, and even for the colossal, in both architecture and sculpture. The architecture, in general, differs only in size from that of the preceding periods. The long, narrow halls roofed with light materials, which formerly extended along the enclosure walls, began to acquire the dimensions of veritable galleries. Their roofs were supported on solid or fenestrated walls, and sometimes even by ranges of pillars.

The decoration of the architraves in the Koh Ker style presents two innovations: first, the very prominent central motif sometimes represents mythological scenes or legends; second, the console, which had served as a sort of capital for colonnettes, disappears. The decoration of the colonnettes remains unchanged otherwise, except for the moldings around the shaft, which are enlarged at the expense of the plain surfaces. Whereas the frame of the pediments — in most cases in ruins — seems to have remained more or less unchanged also, a new type of triangular pediment appears, copied from wooden architecture. The tympanums are increasingly ornamented by foliate motifs.

In addition to works imbued with the rigid hierarchism typical of Angkorian art, the statuary, which is of monumental proportions in keeping with the architecture of the period, includes single figures and groups of images that manifest a powerful dynamic quality and a sense of movement quite unusual in Khmer art: the dancing Śiva, a striding Garuḍa, wrestlers, and fighting monkeys. The faces are less severe than those of the preceding period, and sometimes the expressions are almost smiling; the nose is slightly aquiline, the line of the eyebrows less severe. The figures display the pleated garment of the Bakheng style, but their diadems are richer and their jewelry more lavish. The most striking feature of the animal sculpture is the two-horned diadem adorning the naga heads.

Banteay Srei (second half of 10th cent.). The first ten years of this period witnessed the return of the capital from Koh Ker to Angkor and the building of the temples of East Mebon (952) and Prè Rup (961), under Rājendravarman, and constituted a transitional phase, marked by an endeavor to renew the traditions of the reigns of Yaśovarman and his sons (Bakheng period). A new style, characterized at once by the pursuit of archaism and a search for new formulas, was inaugurated with the building of Banteay Srei (967) and, shortly thereafter, of Prasat Sralau and the monument behind Prasat Kleang North.

The decoration of the architraves, though largely modeled after that of the Prah Kô period, presents a new motif in the form of the floret emerging from a calyx cup. With their notably simple decoration, the colonnettes of Banteay Srei might be said to interrupt the over-all development, a steady tendency toward increasing richness. The moldings, each of which took up an eighth of the shaft height, have been discarded, and the space they occupied has been left blank; the archaic strain is manifest in the reappearance of some round colonnettes. None of the pediments of the transitional period represented by the East Mebon and Prè Rup has survived. Those of Banteay Srei, however, are extremely varied: the edges of the frame terminate in profile *kāla* heads, spewing forth the heads of polycephalous nagas dangling pendants. An important innovation in the decoration of the tympanums (PL. 377) is the introduction, among the foliate motifs, of mythological scenes, which in some cases occupy the entire surface. The exterior wall decoration displays an extravagance more akin to metal engraving than to stone carving. The arches framing the figures flanking the real and blind doorways terminate in naga heads, some of them highly stylized.

The prevailing trend of development can be perceived more readily in the statuary, which continues the tradition of Koh Ker, but in images that are less original than those of Koh Ker reveals a degree of archaism. The figures are smaller, the faces softer, and the eyebrows slightly sinuous. The garments are of two types: one similar to the pleated garment of the preceding periods, the other a reversion to the earlier smooth garment. The diadem is the same as that of the preceding style, but in some cases it is omitted in favor of a tall hairdo alone. The animal sculpture was also enriched with new forms. The major innovation of the Banteay Srei style is the relief carving adorning the tympanums, spacious and singularly harmonious in composition; the figures are disposed with a remarkable sense of balance, and their surroundings are suggested with a few simple details.

The Kleangs (very late 10th, early 11th cent.). The most important monuments of this style, which completes the first phase of Angkorian art, are the pyramid of Takeo (PL. 368), Prasat Kleang North, Phimeanakas, the gopuras (monumental gateways) of the royal palace, and Prasat Kleang South. From an architectural viewpoint, this period is characterized by disappearance of the brick towers, at least from the more important architectural complexes, and the development of the pyramidal structure surmounted by a group of stone sanctuaries with surrounding galleries. The Phimeanakas gallery, the first to be vaulted with sandstone, is very narrow.

The decoration of the architraves, which lacks originality and is somewhat monotonous, retains the *kāla* head as central motif on the strongly dipping scroll. The colonnettes, which initially are as soberly decorated as those of Banteay Srei, gradually become encumbered with moldings, and the small leaves adorning their shafts become stylized to the point of assuming the aspect of sawtooth ornament. The pediment frames maintain the line introduced at Banteay Srei, while the tympanums are adorned with the plant motifs of the styles prior to Banteay Srei.

The sparse statuary remaining from this period, some of which seems to constitute a sort of compromise between the Bakheng style and that of Banteay Srei, is hieratic in its general aspect, though the faces usually have a rather gentle expression. The long, pleated skirt worn by the female figures is characterized by a sort of fishtail drape just above the ankles. In comparison with the animal sculpture of the Prah Kô style, that of the Kleangs is less realistic and somewhat coarse.

STYLES OF ANGKORIAN ART, SECOND PHASE. The reign of Sūryavarman I lasted through the first half of the 11th century and opened the second major period of Angkorian history, which was marked by westward expansion of Cambodian power and by development of the cult of deified royalty that, after Saiva beginnings in the 11th century, became Vishnuite in the first half of the 12th century and, finally, Buddhist at the end of the 12th. However, in the history of Khmer art the reign of Sūryavarman I, to whom is attributed the completion of Takeo and the building of the gopuras of the royal palace, both of which continue the style of the Kleangs, represents a period of transition from the latter to the Baphuon style, which flourished in the second half of the 11th century and was followed by the styles of Angkor Wat and the Bayon. The new edifices attributable to Sūryavarman I — namely, Phnom Chisor, Chau Srei Vibol, and Prah Vihar — present no changes worthy of note.

In architecture, some hesitation is still noticeable in the construction of stone vaulting. As already noted, the surrounding gallery of Phimeanakas, the first such gallery to be vaulted in stone, is very narrow. The gopuras of the royal palace are built of a combination of brick and stone. At Prah Vihar the arched section of some vaults is of brick, supported on stone foundations, while others there are built entirely of stone and remain very narrow.

The decoration of the architraves, colonnettes, pilasters, and blind doorways contains virtually nothing new. Only the frame of the pediments reflects a degree of evolution, a trend that had in fact begun during the preceding period: the *kāla* heads have been permanently abandoned, and the polylobed arch, which now terminates directly in naga heads on either side, seems to comprise the body of the serpent.

The statuary merely continues the style of the Kleang period, the only innovation worthy of note being that the nagas forming balustrades are mounted on low walls; these foreshadow the dadoes of the 12th century.

The Baphuon (second half of 11th cent.). The monuments most characteristic of this style are the great pyramid temple of the Baphuon itself (PL. 369), with its gopuras, the temple raised in the center of the West Baray (a vast artificial lake), and Prasat Khna Sen Keo. From an architectural viewpoint, the Baphuon is noted for the vaulted stone galleries that surrounded three of its five terraces, interrupted on all four sides by towered gopuras. The top gallery, now in ruins, is the earliest example of an attempt to support stone vaulting on rows of pillars; but the summit of this vault rests on a median wall, so that the gallery is divided into two half galleries, the one opening toward the exterior, the other toward the interior.

Although the decoration of most architraves still consists of foliate motifs, and a foliated scroll that dips strongly in the middle, a few begin to present scenes with figures. The disposition of the moldings about the shafts of the colonnettes continues to follow the traditional order, but the decoration of the crown has been reduced to little more than an accumulation of superimposed projections. The smooth, rounded frame of the pediments seems to echo the undulating body of the two nagas whose heads adorn its ends. Where the architrave below is adorned with a scene, the tympanum decoration consists merely of foliate motifs. The pilasters, with the long notches typical of this period, have a rather original arrangement of rinceaux divided by small leaves.

Whereas the early Baphuon statuary differs little from that of the Kleang period, the later works are characterized by an elongation not altogether free of mannerism. The faces, with small noses, fleshy lips, and dimpled chins, have a gentle expression; the eyes are represented summarily by incisions or blank cavities, and the beard and mustache by bracket-shaped lines. The garment appearing most frequently is high in the back and fairly similar to a type that appeared in the Kleang period; however, a few figures display a garment that may be copied from a type of the Banteay Srei period. Low-relief sculpture figures abundantly in the Baphuon style. Apart from the above-mentioned scenes, those adorning some of the architraves, there should be noted the small carved panels, square and rectangular, which are superimposed from floor to ceiling on both sides of the walls flanking the entrance to the galleries and which represent episodes from mythology and the Indian epics. Each panel contains a small number of figures grouped on a single plane, and scenery is reduced to the bare minimum required for identification of the episode presented. The in-

tervening wall space is filled with representations of birds. Indeed, images of animals of all sorts abound throughout this monument and constitute one of the characteristic features of the Baphuon style. Prasat Khna Sen Keo is also adorned with figural scenes, which correspond closely to those in the Baphuon.

Angkor Wat (first half of 12th cent.). This period, generally regarded as the golden age of Khmer art, encompasses the building of a series of great monuments, beginning with Beng Mealea, Prah Palilay (a sanctuary recently reconstructed by anastylosis), which rises on the summit of the Bakong pyramid, and Phimai (Siam), all of which probably date from the first quarter of the 12th century; these were followed by Prah Pithu, Chausay Tevoda, Thommanon, the central sanctuary of Prah Khan (province of Kompong Thom), Angkor Wat, Athvea, and Banteay Samrè, all built — or at any rate completed — at a later date. Above all, this period is celebrated for its architectural realizations. Because of the skill of a brilliant architect, or of a school of gifted architects, the conception and execution of the building plans attained a degree of perfection never equaled before nor since in Khmer art.

Beng Mealea, a vast complex of buildings that rise from the same ground level, comprises a massive central sanctuary with porticoes, surrounded by a series of wide concentric galleries; on the east side, where the principal entrance is located, the galleries are connected by a system of cruciform arcades. This plan foreshadows that of Angkor Wat (PL. 369), which is oriented toward the west. The triumph of the latter monument lies in the fact that, viewed from the outside, it gives the impression of being a solid pyramid capped with five towers in quincunx, a structure differing only in size from the preceding pyramid temples, whereas it is in fact provided with the same concentric galleries as Beng Mealea; but the galleries of Angkor Wat, increasing progressively in height, rise one above the other like the tiers of a pyramid. The system of cruciform arcades connecting the outer to the median gallery at Beng Mealea, where both are on the same level, reappears on the west side of Angkor Wat. Here, however, in order to solve the problem of connecting galleries on different levels, the architect devised a system of telescopic or superimposed galleries, which constitutes not only one of the most impressive architectural elements of the edifice but also a remarkable independent achievement. With the exception of the two small temples of Chausay Tevoda and Thommanon, where the combination of brick and stone is continued, for the obvious purpose of reducing the weight of the vault, all the galleries of the Angkor Wat period are vaulted entirely in stone. At Beng Mealea, some of the vaults are supported on a wall and a row of pillars, others on two rows of pillars. Both these formulas reappear in a more elaborate form at Angkor Wat, where a second, outer row of pillars, parallel to the first, supports a half vault. The superstructure of the towers is raised, as customary, in a series of receding stories, but many denticulations, having projections adorned with antefixes, modify the recesses created by the passage from one story to the next.

Khmer art offers no more elaborate and involved decoration than that produced by the artists of the Angkor Wat period, who would appear to have been inspired with a veritable horror vacui. Whereas some of the architraves repeat the foliate decoration of those of the preceding period, with the addition of small human figures, others present a new type of decoration consisting merely of rinceaux, which all coil in the same direction on either side of a *kāla* head. The shafts of the profusely decorated colonnettes are divided into as many as ten bands, and some sixteen-sided colonnettes tend to look almost circular in profile. The highly ornate pediment frames are once more adorned with the heads of divergent monsters emitting nagas, while the tympanums display a mythological personage, often placed above several rows of subsidiary figures in attitudes of adoration. The figures adorning the walls may be executed without an enframing arch, as is the case with most of the numerous apsarases at Angkor Wat (PL. 376), but those arches which do appear terminate either in nagas or birds.

The statuary, often works of large scale, is reminiscent of that of the hieratic period. The square faces have contiguous eyebrows, small noses, and full lips. The male garment is shorter than in the preceding periods, and the female garment, known best from relief carvings, faithfully reproduces the appearance of a material embroidered or printed with flowers and has voluminous flounces, or floating panels, on either side. Jewelry becomes of primary importance, and the diadem curving over the temples affects the form of a crown. The apsarases of Angkor Wat display remarkable, excessively ornate jeweled tiaras with high peaks.

The bodies of the nagas forming balustrades are mounted on evenly spaced dadoes or on carved stone blocks, and their polycephalous hoods are framed with an aureole of flamelike motifs that encloses a small representation of a Garuḍa. The lions have highly stylized manes and are represented standing on all fours, while the bulls have barely perceptible humps and stand with one leg raised. Finally, it was this period which saw the development of the vast relief compositions adorning the walls of the galleries that open outward at Angkor Wat (PL. 370; III, PL. 300; VII, PL. 255). These compositions are executed in very low relief, at times suggesting a large panel painting rather than sculpture, and manifest the same horror vacui prevailing throughout this monument, so that practically no surface remains unadorned.

The Bayon (last quarter of 12th, beginning of 13th cent.). As was noted earlier, the art of the Bayon period, that is, the art produced during the reign of Jayavarman VII (1181–1219), was long subject to erroneous dating. After the great revision of the Khmer chronology, effected between 1927 and 1929, works of this style were attributed wholesale to the reign of Jayavarman VII; albeit certain scholars believed that the oldest monuments in the style might be of an earlier date — notably Gilberte de Coral-Rémusat, who considered the oldest parts of the temple of Ta Prohm as representative of a transition period, datable to the mid-12th century and extending from Angkor Wat to the Bayon. Through rigorous application of his analytic method, and with the help of information provided by the stele discovered at Prah Khan in 1939, Philippe Stern was able to fix quite precisely the date at which the style of the Bayon (PL. 372), whose earliest works do not antedate the reign of Jayavarman VII, underwent important modifications, apparently as a result of the elaboration of the concept of the monarch.

This style departs from those that preceded it in that it was exclusively of Buddhist inspiration and was influenced to a greater extent than any other by the character of the ruler. About 1190 this monarch, who during the first ten years of his reign had conformed, in all except matters of religious belief, to the traditions of his predecessors and had devoted himself, first, to carrying out works of public utility (hospices, roads, inns) and, then, to providing for the funerary cult of his parents (temples of Ta Prohm, dedicated to his mother, and Prah Khan, to his father), established a new concept of the cult of deified royalty adapted to the Mahayana Buddhism he professed and, at the same time, promoted the cult of the Bodhisattva Lokeśvara. This innovation determined the markedly original change in aspect of the towers, which were now ornamented on all four sides with huge smiling faces, unanimously recognized as representations of the royal visage in the aspect of the Bodhisattva (PL. 373). Such towers, connected by galleries, were added to existing monuments and incorporated into those in process of construction as well. At the same time, enormous enclosures were built to delimit the sacred precincts, and surrounding galleries opening inward were added, thereby placing the innermost gallery and the central sanctuaries within a sort of cloister. The structures thus became complicated and cluttered, and this building frenzy, these repeated modifications in the course of construction, allied to a growing scarcity of fine sandstone in the quarries of Phnom Kulên, resulted in hasty and careless construction, arbitrary combination of laterite with sandstone, and often shoddy or unfinished decoration.

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

A curious result of the premium on speed of construction in this period was the development, shortly before the appearance of the towers with faces, of a new formula for representation of the blind windows with balusters — which, in fact, provided Stern with a major clue to distribution of the monuments of the Bayon style over several successive phases. In the oldest parts of both Ta Prohm (1186) and Prah Khan (1191), the balusters of the blind windows are represented in their entirety; in the later parts of Prah Khan, however, the top two-thirds of the balusters are seemingly hidden behind a lowered blind, suggested by leaving the stone uncarved. Since this time-saving device was not applied at Ta Prohm, it must have been adopted after the completion of this monument but before the building of Prah Khan, and also therefore before the introduction of the towers with faces, which are absent at Prah Khan.

Thus, in the Bayon style there can be distinguished three successive phases — or, more specifically, two early phases and a late phase. To the first of the early phases, prior to 1190, belong the old parts of Banteay Kedei, Ta Prohm, the Prah Khan at Angkor and its annexes (Neak Pean; PL. 374), and the enclosure added to the Prah Khan at Kompong Thom, which was copied from that of the Angkor Prah Khan. The style remains fairly close to that of the Angkor Wat period, and it was toward the end of this phase that the blind windows began to be represented as if with lowered shades. To the second of these early phases, characterized by the appearance of the towers with faces, the pediments framing large figures of Lokeśvara, and the consistent application of the time-saving formula for representation of blind windows, belong the enclosures of Banteay Kedei and Ta Prohm, the gallery passages added to these same temples, the modification of Neak Pean at the Angkor Prah Khan, the Prah Thkol, located near the Prah Khan at Kompong Thom, Wat Nokor at Kompong Cham, Ta Prohm at Bati, the early part of Banteay Chmar, and the city walls of Angkor Thom.

The third phase, which probably dates from the beginning of the 13th century, encompassed the completion of Banteay Chmar, the building of the Bayon (which also underwent numerous alterations in the course of construction, such as the side passages added between the outer and inner galleries, access ways subsequently demolished), and the building of the Terrace of the Elephants and the Terrace of the Leper King, to the east of the royal palace of Angkor Thom.

The decoration of the Bayon period presents no new elements worthy of mention and is generally executed in perfunctory fashion, with the notable exception of that of the central tower of the Bayon, which despite its late date appears to have received particular care from the royal sculptors. In the early Bayon style, the central branch on the architrave is invariably segmented and appears to describe a series of ascending and descending curves; later, the branch is replaced by foliate spirals, alternately opposed and adorned with large pointed leaves. The decoration of tiny sawtooth leaves disappears from the colonnettes, and only heavy torus moldings, disposed without regard for the canons so strictly observed in the past, remain on the shafts. Both the tympanum, with its central figure and rows of subsidiary adorant figures, and the pediment frame continue the traits of the Angkor Wat period. The figures adorning the walls were at first surmounted by an arch terminating in naga heads or birds; later, however, this member was resolved into a series of rinceaux. The surviving decoration of the pilasters is in general rather inferior.

The statuary of this period, in consequence of the importance assumed by the cult of deified persons during the reign of Jayavarman VII, understandably includes many images executed in series and is noted especially for its facial expression, for under the influence of Buddhism it changed radically from that of the preceding periods. Scholars have conjectured the influence of the Buddhist statuary of the Dvaravati kingdom in the characteristic expression, the half-closed eyes and vaguely smiling lips that seem to reflect an inner beatitude and a state of mystic meditation. As the Bayon period progressed, gradually the eyes closed entirely and the smile became more pronounced, so that a few of the later figures suggest efforts to realize recognizable portraits. Although these faces have a singular charm unknown to earlier Khmer art, and though the modeling of the bust occasionally manifests some degree of realism, the proportions of the lower limbs, are more ponderous than even those of the Angkor Wat statuary, and the scale of the feet borders on the monstrous. The male garment, which is very short and edged with a pearl motif, has an anchor-shaped fold in front; the female garment, like that of the Angkor Wat period, reproduces a material adorned with flowers, but instead of having flounces or floating panels at both sides, it now has only one in front. The Buddhist images have no distinctive type of headdress: the Buddha is represented with his traditional cranial protuberance (*uṣṇīṣa*) covered with small curls, and the Bodhisattva Lokeśvara displays a cylindrical chignon, adorned in front at its base with a small image of the seated Buddha. The female images of Prajñāpāramitā are also represented with a conical protuberance, almost identical to the *uṣṇīṣa*; but like the rest of the head, the projection is covered with small, flat tresses, and it is adorned in front with the same figurine as the bodhisattvas. The headdresses of the divinities adorning the wall areas flanking the entrances are much simpler than those of their counterparts at Angkor Wat. The only genuine innovation in animal sculpture is the representation of a Garuḍa straddling the heads of the nagas forming balustrades.

From a historical and iconographic point of view, the reliefs on the gallery walls of the Bayon and Banteay Chmar (PL. 371) are of far greater interest than those of Angkor Wat, but they are vastly inferior in artistic quality. This estimate is especially true of the carvings in the inner gallery of the Bayon, which must have been executed at a later date than the rest and could hardly be of poorer workmanship. On the other hand, the scenes carved on the Terrace of the Elephants (PL. 374) are comparatively realistic, and the figures disposed in registers on the walls of the Terrace of the Leper King, which approach high-relief sculpture, are outstanding in quality.

MAIN TRENDS IN THE DEVELOPMENT OF KHMER ART. It may prove of value to conclude this study of Khmer art with some attempt to define the general trends of its development in the several fields of architecture, decoration, and sculpture and to record the outside influences that affected this development.

From the 7th century, the as yet isolated towers began to be grouped on a single base, and from the 9th century such grouping became the rule. Although the most common disposition was that of three towers on one base, there are also groups of four (double rows of two towers each at Lolei) and of six (double rows of three towers each at Prah Kô). At Bakong, eight towers are symmetrically disposed around a pyramidal structure, from whose top story rises a tall sanctuary surrounded by twelve turrets.

In 881 the building, at Bakong, of the first great pyramid of stone (heralded by the cautious experiments in brick at Ak Yom and Rong Chen on the Kulên) constituted a major step in the development of the Khmer temples and was an innovation directly related to the cult of the god-king (*devarāja*), or the deified royalty. These pyramids are commonly known as "temple-mountains." This was the designation used by the Khmers themselves, because the edifices symbolized the cosmic mountain and were raised in the center of the royal city, which itself constituted a miniature reproduction of the universe. Between 881 and the beginning of the 13th century, the Khmer rulers built about ten such temple-mountains.

The pyramid of Phnom Bakheng (PL. 368) has twelve towers on each of its five stories and is crowned with five towers disposed in quincunx; the latter arrangement was to remain characteristic of the greatest monuments of Khmer architecture. The East Mebon (952), whose central group consists of a quincunx arrangement of sanctuaries surrounded by eight other towers, is provided with long halls on the first story of its pyramid. The inner enclosure at Prè Rup (961), a three-storied pyramid, with the twelve turrets of its first story surrounding a quincunx of towers on its summit, is flanked by separate corridors that were roofed with perishable materials. Takeo

(PL. 368), another five-storied pyramid also surmounted by a quincunx of sanctuaries, has a brick-roofed surrounding gallery on its second story and two other corridors, also roofed in brick, extending from either side of the eastern gopura on its first story. The narrow surrounding gallery on the summit of the three-storied pyramid of the Phimeanakas was the first to be vaulted with sandstone. Continuous and concentric stone-vaulted galleries surround the first, third, and fifth stories of the five-storied Baphuon (PL. 369), and three concentric galleries enclose the central sanctuaries at Beng Mealea and Angkor Wat. Both of the latter temples are provided, on the principal flank, with a system of cruciform cloisters connecting the outer and median galleries.

Thus, it is evident that the elements properly termed "surrounding galleries" did not appear until about the end of the 10th or the beginning of the 11th century. Undoubtedly because of the inexperience and caution of the builder, the first gallery vaulted with sandstone was very narrow, but subsequent ones became steadily wider. A gallery supported on rows of pillars appeared about the middle of the 11th century, and the 12th century developed a gallery supported on one side by a row of pillars and on the other by a blank wall. This disposition encouraged the adornment of the wall, illuminated by the light entering between the pillars, with vast compositions in low relief (Angkor Wat, the Bayon, Banteay Chmar; PLS. 370, 371, 375). The various types of edifices briefly described include, in addition to the characteristic elements already mentioned, one or more concentric enclosures interrupted — sometimes on all four sides, sometimes only in front — by gopuras, as well as annexes (minor sanctuaries, libraries, storerooms) variously disposed among the several enclosures.

Despite their almost certain lack of surveying instruments and their rudimentary technical methods, the Khmers were able to realize with great accuracy plans that were often very complex. It seems likely that the builders worked from a model, all dimensions of which were multiplied by the same coefficient. Since the Khmers did not have scaffolding adequate to raise heavy blocks of stone to great heights, it is probable that they used the inclined plane, a technical device which, like the use of models, was also employed in Siam before the adoption of European methods.

As to the time required for construction of the monuments, the known dates and the changes of style from one reign to the next would seem to indicate that it was much shorter than might be supposed on the basis of techniques and scale. It has been roughly calculated that a brick tower about 40 ft. high and 16 ft. on a side at the base could probably have been built in a month, and that a maximum of thirty years must have sufficed to erect the vast complex of Angkor Wat, which is the work of a single interval and shows no sign of any change of style in the course of construction. It must be added that the monuments were raised entirely of rough-hewn blocks, for no carving had been done before their placement. Although the masons and sculptors worked independently of each other, they were able to proceed simultaneously soon after the building was begun, since the sculptors began decoration of the lower courses of the edifice as soon as they were in place.

Generally speaking, the decoration, which developed in the 7th century from formulas very close to Indian models, gradually departed from these sources and yet retained the essential elements of the Indian tradition, into which it incorporated new plant, animal, and other motifs treated in a distinctive manner. For example, throughout the history of Khmer art, except in the last phase of the Bayon style, the central motif of the architrave decoration remained an arc, which probably symbolized the rainbow as the link between the world of men and the world of the gods, for like the rainbow this member constituted a link between the profane outside world and the sacred precincts of the temple. This arc might subsequently assume the form of a foliated branch, might curve unbroken or be segmented, and might even change in decorative motif; but the basic scheme, of Indian origin, always remained the same — though the inventive genius of the Khmer sculptors often transformed it beyond recognition.

The underlying tendency in the evolution of the colonnette was toward an increase in the number and size of the horizontal moldings about its shaft; these bands gradually encroached upon the bare surface areas and reduced the rows of small leaves bordering them to minor sawtooth ornament. Nevertheless, through all these transformations the colonnette remained what it had been originally, namely, a translation into stone of the Indian wooden column, as is represented in a fresco at Ajanta (q.v.). The pediment, initially in the form of an inverted U like its Indian counterpart, evolved finally into a polylobed arch. The ends of these members were first adorned with *makara* heads and then with *kāla* heads each spewing forth a naga. The latter motif, with wide variation, remained the essential element of the frame. The tympanum decoration, at first a representation of a miniature edifice and then of a divinity framed within such a structure, eventually became schematic and dissolved into foliate motifs, which persisted on some tympanums even after the introduction of figural scenes.

Stylistic analysis of the statuary reveals certain general trends in its development. During the period lasting from the end of the 6th to the end of the 9th century, familiarly known as the "period of youth and vitality," the Indian sculptural canon was gradually abandoned, though a vestige of the Indian *tribhaṅga* subsisted in the slight inflection at the hips. At the same time, the sculptors overcame their early uncertainty and progressively eliminated the framing arch and the other props they had relied upon to bolster the limbs of their statues. The modeling of the anatomy evidences some striving for naturalism; the garments are smooth and cling to the body contours, and the male figures are crowned with tall cylindrical tiaras.

With the onset of the 10th century, there began a period in which the sculptors sought to impart to their images an aura of hieratic majesty. The inflection at the hips disappeared, and there was no longer any attempt at realistic modeling of the anatomy. The massive forms achieve an effect of vigor and power, and the features are set in a severe expression. These figures are clothed with a pleated garment and display a jeweled miter. The ensuing period, a somewhat archaizing phase, lasted from the end of the 10th through the 11th century and was characterized by a degree of relaxation in the whole figure, as well as a softening of the facial expression. Finally, after the return to a hieratic style in the first half of the 12th century, the second half of this same century brought an entirely new type of statuary, in which only the face, with its half-closed eyes and smiling features expressing Buddhist gentleness and mysticism, seemed to merit artistic attention.

Relief sculpture, used in architectural decoration for the architraves and tympanums, calls for separate treatment. During the pre-Angkorian period, compositions in low relief were incorporated in the architraves over the entrances to the sanctuaries and in the medallions adorning the exterior walls. At the beginning of the Angkorian period, this decoration came to include human figures, which were represented under the arcature flanking the doorways, as well as on the tympanums and the interior walls of the cellas. Episodes with figures appeared for the first time in the tympanums at Banteay Srei (PL. 377); in the Baphuon, mythological and epic scenes represented in small panels covered the gopura walls both inside and out. Finally, at Angkor Wat, the Bayon, and Banteay Chmar, the galleries half-supported by pillars have their walls adorned with linear mythological, epic, or historical scenes, extending uninterruptedly along the entire length of the panel. The purely decorative ornament abounding throughout these edifices was of a consistent richness that in many cases resembled metal engraving rather than stone carving in effect.

External influences affecting Khmer art in the course of its evolution have already been stressed in the description of the styles of the successive periods. Indian influence dominated the initial stages and left its mark on the 7th-century complex of Sambor–Prei Kuk. Circumstances of history determined the influence that both Champa and Java exerted on Khmer artistic development in the 9th century; and the advent of Buddhism, which became the official religion at the end of the 12th century, caused Khmer sculpture to be influenced by that

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

of the old Buddhist kingdom of Dvaravati. Besides these outside influences affecting its development there was the marked tendency of Khmer art to archaize, a tendency repeatedly manifest in the revival of certain motifs of its artistic past. Thus, the Kulên style borrowed from that of Sambor–Prei Kuk, the style of Banteay Srei revived motifs of Prah Kô, and the artists of the Angkor Wat period did not disdain to turn for inspiration to the styles of Banteay Srei and the Kleangs.

MINOR ARTS. Of the surviving examples of the minor arts of ancient Cambodia, only the bronzework and ceramics are numerous enough to encourage any judgment of artistic value. Most of the ancient bronzes presently known are statuettes of divinities, probably from private houses and also from temples, where they served as *utsavamūrti* (ceremonial images) and were carried in processions in lieu of the great stone idols (obviously far too heavy to be moved), whose aspect these small bronze images faithfully reproduced. The remaining bronzework consists of an assortment of ritual objects, such as bells, the vajra (thunderbolt), and vessels for lustral water, domestic utensils, and fragments of furniture, whose chief interest perhaps lies in the fact that they are the models for the utensils represented in the relief carvings.

The ceramic ware, sober and almost classical in form, was coated with a brown or blackish slip and adorned simply with a few incisions in the paste. In contrast to the austerity of the ceramics, the gold and silver objects — to judge from the rare surviving examples — were of a decorative richness approaching that of the ornamental stone carvings. The proficiency the Cambodians continue to display in reproducing, in precious metals, the motifs carved on their ancient stone monuments proves to how great an extent this decorative art is an inherent expression of their artistic genius.

KHOTANESE ART. Khotan (Chin., Yü-t'ien) was not only a small kingdom playing a conspicuous role in Central Asian history, but also a region with its own important culture and religion. Artistically the region received a variety of influences, some coming from northwest India via either the valley of Swat or other routes, others clearly Iranian, Chinese, or Chorasmian, all of which were soon reinterpreted. Generally speaking, popular work, such as the terra-cotta figurines, exists side by side with a higher level of production, exemplified by the Buddhist monuments. Khotanese Buddhist art had great influence at Tun-huang (q.v.) and especially in Tibetan Buddhist art (see TIBET; TIBETAN ART), where one of the more ancient styles is specifically called "Khotanese."

SUMMARY. Name and culture of the region (col. 991). Historical sources and modern exploration: Basis of the dating system (col. 992). Typology and value of the Khotanese finds (col. 994). Rawak (col. 995). Dandan-uilik (col. 996). Niya (col. 998). Endere (col. 998).

NAME AND CULTURE OF THE REGION. The region of Khotan developed an important civilization as a result of its location south of present-day Chinese Turkistan: it was an important stage on both the Silk Route and the roads from India and was particularly important in transmitting culture currents from eastern Iran and Sogdiana (q.v.) to the Far East. These currents, in turn, had been subjected to strong classical influences from the eastern Mediterranean and India, by way of Kashmir (see KASHMIR ART), and were at some periods influenced by the art of Gandhara (q.v.), as well as that of eastern Iran. This helps to explain the complex picture presented by the region, where Chinese influences also were at work at the end of the Han period (about the beginning of the Christian Era). These reached Khotan either by way of the Chinese colonies situated along the southern Silk Route from Lou-lan or by way of Niya and Keriya. Underlying these various influences and cultures was an ancient indigenous civilization, traces of which have been discovered at Yōtkan.

The various names given to the administrative center in different periods reflect the complexity of the culture. The royal city was first called "Yü-t'ien" by the Chinese, presumably from the original "Odan." Later, in the 7th century, Hsüan-tsang, speaking of this region, calls it "Ch'ü-sa-tan-na," which corresponds to the Khotanese "Gaustamä" (according to Sylvain Lévi, the transcription of the Indian form "Gostana"). Hsüan-tsang adds that in the native language it is the kingdom of Huan-na," which the Hsiung-nu (a Turkic tribe) call "Yü-tun," the Iranians "Ho-tan," and the Indians "Ch'ü-tan" (S. Beal, *Hsüan-tsang's Si-yu-ki, Buddhist Records of the Western World*, London, 1884). Leaving aside the indigenous name, which must have been something like "Hvanna," the Turkic name evidently represents a variation of the form "Odan" and probably corresponds to "Odon," while the former two transcriptions represent the two forms "Hwatan" and "Khutan," which lead to the name "Khotan." The ancient name "Odan" ("Odon") reappears in the Mongol period. The form with guttural continued to be used by the Iranians and the Indians, while the Chinese used both forms at various times.

HISTORICAL SOURCES AND MODERN EXPLORATION: BASIS OF THE DATING SYSTEM. This little kingdom, whose rulers apparently had names of Indian origin, soon took an active role in the diffusion of Buddhism (q.v.). As early as the end of the 2d century there is a reference in the *Mou-tsŭ* (a Buddhist polemic) to a person who is said to have visited Khotan and to have found an existing Buddhist community. Chou Shih-hsing, the first Chinese Buddhist pilgrim of whose travels beyond China there is no doubt, left for Khotan in 259 and died there at the beginning of the 4th century. In spite of the promising titles of certain texts, among them Abel Rémusat's *Histoire de la ville de Khotan* (Paris, 1820) and the Tibetan chronicle entitled "The History of the Kings of Li-yul" (see F. W. Thomas, *Tibetan Literary Texts and Documents concerning Chinese Turkestan*, I, London, 1935), as well as other works published on the subject, little is actually known about the history of Khotan or of Buddhism there. The ancient royal city was probably abandoned during the 11th century, following the destruction of the temples and palaces during the Moslem invasions that had been described by Hsüan-tsang in the 7th century. The site about five miles northwest of the new Chinese city of Khotan (Ho-t'ien), where numerous archaeological vestiges have been found, was probably the ancient royal city. However, Buddhism must have survived in the region for several centuries longer, at first during the Moslem Ilkhan rule, later under the Kara-Khitai, and lastly under the Mongols, who favored the older religion. Marco Polo (late-13th cent.) speaks of "idolaters" — Buddhists — in the city, but, aside from the Moslems, he does not mention representatives of other religions. However, Gardēzī, writing in the 11th century, had reported two Christian churches. In the following centuries Islam was imposed upon the last members of non-Moslem communities, and the culture of this region declined and was forgotten.

Khotanese culture belongs to a complex formed by all the sites on the southern Silk Route and can be interpreted only in context with such sites as Niya, Endere, and those of the Kashgar region; the area includes various sites, of which the most important are Yōtkan, the ancient pre-Islamic royal city, and Rawak and Dandan-uilik, which were monastic cities. Yōt-

993

kan supplies only fragmentary documentation, because no systematic excavation has as yet been carried out there. Rawak and Dandan-uilik are architectural complexes which have been examined with some care by Aurel Stein. These complexes date from different periods. They can be compared to the westerly Kashgar sites, which have suffered great destruction, and to the better-preserved sites of Niya and Endere to the east.

During a visit in Khotan, F. Grenard bought fragments of pottery and other objects which were the first to arrive in Europe; their provenance, he was told, was a site called "Yār" or "Yōtkan." He visited this site and identified it as the ancient capital of the region. After Aurel Stein visited the same location, he said that the site consisted of a depression enclosed by steep sides cut into what first seemed to be natural loess, but on closer examination was seen to be layers of pottery, ashes, and pure soil. He concluded that the depression had been excavated by the local population in their search for gold and precious objects, and learned that the site had been discovered about 1870, when tiny flakes and fragments of gold leaf had been found after a flood had eroded a ditch through the loosely packed soil. The natives then began to exploit the site and each year at flood time washed the soil for gold and small objects of value. Unfortunately Stein went there during the dry season when work was not in progress; he could not therefore obtain *in situ* objects which could be related to each other according to the strata in which they had lain.

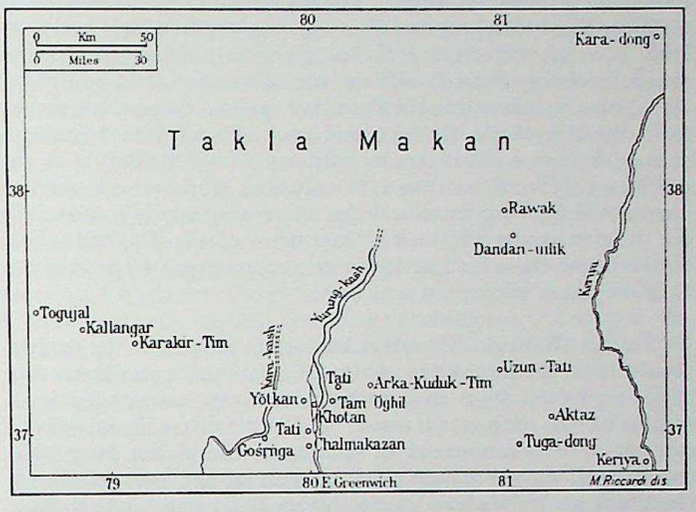
The depth of the deposit of debris showed that the site had been occupied over a long period of time. There is neither any extant architecture nor evidence of suitable stone for building; judging from excavations, construction materials seem to have been sun-dried bricks and clay with reinforcing timbers. When covered by cultivated soil wet by irrigation, these materials gradually disintegrated. Only works in lasting materials — ceramic, stone and metal — survived.

Since all the pieces known were acquired by purchase and their stratigraphic position is unknown, there is no clear historical record of Yōtkan from artifacts. The site must have been continuously occupied from an early date until the 11th-century Moslem invasion and perhaps even slightly longer; it is impossible to tell at what moment and for what reason it was abandoned.

Descriptions of the royal city and its monuments were left by Chinese pilgrims. Fa-hsien (see H. A. Giles, *The Travels of Fa-hsien* . . . , 2d ed., London, 1956) reports, at the end of the 4th century, that he visited a magnificent stupa, located slightly west of the city, part of which was richly covered with gold. Sung-yün (see E. Chavannes, *BEFEO*, III, 1903, pp. 379–441) visited the city in the 6th century and mentioned that there were temples and pagodas and that one temple contained frescoes representing Rāhula, who had appeared as Buddha at a nearby site. Hsüan-tsang writes that the oldest sanctuary in the city was a wooden tower with seven stories, and he marvels at the richness of the temple existing in his day. The report of a mission sent in the 10th century notes that the royal palace structures faced the east and that among them was the so-called "Pavilion of the Seven Phoenixes." The annals of the Later Liang dynasty (907–22) record that the king's palace was decorated with frescoes and that the city was surrounded by fairly low walls. Only a few ruins and fragments of decomposed wood remain, a fact proving that all building was done in perishable materials.

However, the complex can be approximately dated by the numerous coins on the site. Since their level has not yet been established, they cannot be directly related in date to the other objects. It can only be stated that a rather important city existed from the beginning of the Christian Era until about the 11th century. Numerous copper coins were found and classed as Sino-Kharoshthi since they bear Chinese inscriptions on one side and, on the other, Prakrit legends in Kharoshthi characters. Representations of a camel and a horse on these coins seem to relate to those of a similar type on coins of the Scythian princes of northwest India. These coins must have been minted by the rulers after A.D. 73, the year in which Khotan fell under Chinese domination for the first time. The oldest pieces found, all of foreign origin, include a coin of Kujūla Kadphises (see KUSHAN ART) from about the beginning of the Christian Era, numerous coins of Kaniṣka, and Chinese coins, perhaps of the Han dynasty (206 B.C.–A.D. 321). Stein also obtained coins of the emperor Valens (A.D. 364–78) and was able to acquire coins from Yōtkan dating from the T'ang (618–907) and Sung (960–1279) dynasties, proving that by the beginning of the 12th century commerce with China had been reopened. A few Islamic coins were found; they may prove that the ancient royal city survived for a while after its Moslem conquest.

Thus, while it is relatively easy to determine the period of the city's development, it is practically impossible to assign



Area of Khotanese culture showing principal archaeological sites.

a precise date to the fragments acquired by Stein, Grenard, and others, because all come from chance finds, with no exact provenance. However, it is possible to attempt some classification of the objects by dividing them into categories and relating some of the fragments to dated materials from neighboring regions.

TYPOLOGY AND VALUE OF THE KHOTANESE FINDS. The first category consists of numerous terra-cotta figurines of animals in the round, almost all of which are decorated with incising representing their coats. There are camels, horses, felines, and, most often, monkeys. The monkeys constitute a separate group, because they reflect human expressions; they often play musical instruments — such as the syrinx, sitar, rabat, and various kinds of drums — or form groups in amorous embrace.

The monkey images appear to be an isolated type, corresponding only to objects found in Sogdiana, and to the rare and undated finds of the Indus civilization (see INDUS VALLEY ART). This remarkable skill in representing animals not found in the Khotan region suggests that the sculptures relate to a much earlier period, when Khotan was in touch with the protohistoric civilizations of northwest India, eastern Iran, Sogdiana, and Chorasmia (Khwarizm).

The second and more common category of finds consists of numerous fragments of plain and decorated pottery vessels. Some are in good condition, among them a little vase resembling an oinochoe and another with a handle in the form of a monkey playing a sitar, a motif also found in the terra cottas. A large jar of amphora type is decorated on its neck with figures of women holding a garland, a popular motif, found on numerous terra cottas and on the Dandan-uilik stuccoes, which seems to have been borrowed from Gandhara. There is also a vase with a male head on one side and a female head on the other, recalling bifrontal Greek vases.

The molded ornaments on vases were made separately and attached before firing. Many of these ornaments were found unattached. Some are grotesque or grimacing masks which reflect either the diffusion, often by means of coins, of the barbarian types throughout Central Asia or the final stylization of barbarian types found in Taxila during the 4th and 5th centuries. A satyr head, adorning a handle, has been treated naturalis-

UP State Museum, Lucknow

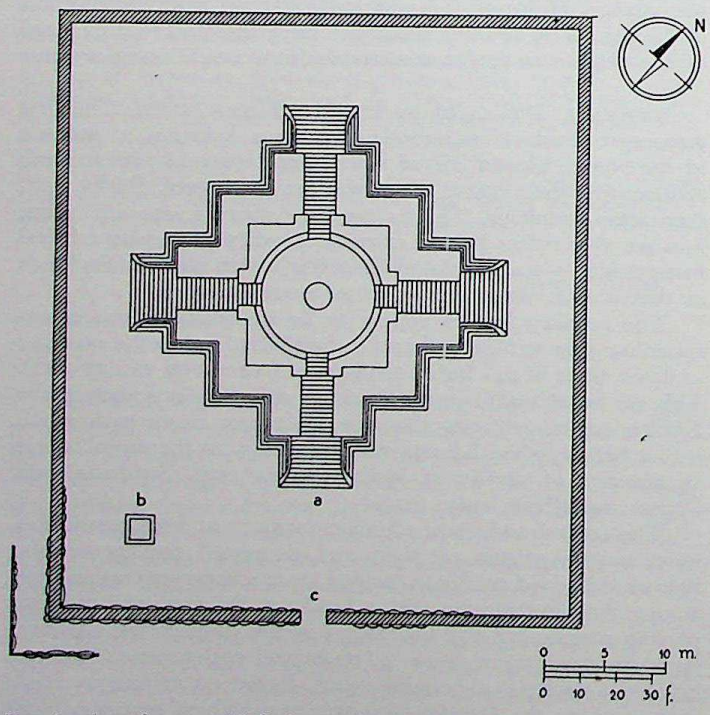
CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

tically and is classical in appearance. The neck of another vase is decorated on one side with two haloed figures seated on lotus pedestals with an elephant *vāhana* (vehicle); on the other side are two parrots above a grape cluster, a motif reminiscent of ornaments used in Gandharan sculpture, as well as in the Ajanta (q.v.) frescoes and even in Coptic embroideries (see COPTIC ART). Another appliqué shows a buddha within a lotus flower. There are also heads, many in the round, that may have been vase decorations. The head of a woman, apparently modeled on a regional type, is like those found among the worshipers in the Dandan-uilik frescoes. The pottery and terra cottas of this local art clearly employ models of every provenance.

The third category consists of fragments which seem to have been imported from different regions. Many little stone reliefs, probably from Gandhara, are carved in schist and soapstone, materials found in the Peshawar region. Some show scenes from the life of the Buddha and probably adorned miniature stupas. Intaglios have been found, some of which seem to be the work of engravers from the Greco-Roman world; two in particular — one showing Eros and the other a quadriga — certainly are Roman works of the first centuries of the Christian Era. Others come from Iran or India; one represents a warrior of the Indo-Scythian type.

RAWAK (Ravaq). The most important site, after the ancient royal city, is the monastery of Rawak, a large complex consisting of a stupa (FIG. 995) in a rectangular court surrounded by a wall which is decorated inside and out with colossal stucco statues. The arrangement of the stupa within the four walls corresponds to the courts with chapels of the monasteries of Gandhara and elsewhere in northwest India and Central Asia.

The stupa has a three-storied base with a centered staircase on each side leading directly to the foot of the dome, so that the base plan is shaped like a Greek cross. The stupa was completely encased in stucco painted white. The greatest interest of the site lies in the decorations of the encircling wall, consisting



Rawak, plan of stupa. (*a*) Stairway; (*b*) base of a small stupa; (*c*) entrance (*from A. Stein, Ancient Khotan, Oxford, 1907*).

of rows of stucco statues. They form a frieze of colossal statues representing buddhas and bodhisattvas in various poses arranged in groups; smaller statues of divinities and arhats fill the leftover spaces. Remains of frescoes on the surfaces not covered by statuary were visible at the time of the excavation. All the statues were originally painted, but no color remains except on parts protected by drapery.

The reliefs were supported by a strong wooden framework fastened to beams thrust into the wall behind. The statues showed no trace of willful destruction; it seems that the site, which had been abandoned quite early, suffered only the slow action of weather before being covered by sand. Moreover, the decorations were probably protected by a wooden roof. Stein recovered only the southeast and southwest portions of the wall, which was paralleled inside by a thinner wall that was probably continuous and decorated on both faces by reliefs, of which practically nothing remains. The passage formed by the inner and outer walls was probably roofed and served as another circumambulatory.

The sculptured frieze shows a close relationship to Gandharan sculpture in the handling of drapery, but with an important difference in that some statues emphasize the form of the body under the garment, while in others the conventional treatment of drapery in waves is similar to the style of Chinese art. Many of the individual statues are reproduced in several examples.

Some statues are individualized, such as that of a seated and apparently nude buddha with a resigned smile, a work like no other at the site. In some heads (PL. 380) there is a similarity, in the modeling of the face, to those found at Tumshuk (I, PL. 477), and a little buddha with crossed legs also resembles the seated buddhas of Tumshuk, in spite of differences in costume and nimbus. A female bust still reflects ancient Hellenistic models. The statuary of Rawak consists mostly of buddhas, bodhisattvas, and arhats, but the gate in the center of the south side is flanked on the inside by two pairs of *dvārapālas* (gate guardians). Almost life size and wearing the local costume, they are preserved from the waist down.

Rawak, therefore, shows similarities to the art of Gandhara, with variations caused, apparently, by local tradition. It is difficult to date this site. The only elements which give any idea about its age are the Chinese *wu-shu* coins placed at the feet of the statues as offerings. These pieces belong to the Later Han period, but were in circulation at least until the end of the 4th century, if not until the end of the period of the domination of Central Asia by the Sui dynasty (581–618). It is necessary to turn to the style of the sculptures to establish an approximate date. They are closer to Gandharan types than are those from Dandan-uilik and Endere, which are of the T'ang period, and not a single figure with multiple arms can be found. The Rawak site therefore can be considered earlier than the T'ang era and is dated approximately between the 4th and the beginning of the 7th century.

DANDAN-UILIK. This site includes many temples assembled in a complex. Dating is quite precise here, since various dwellings, undoubtedly monastic, contained Sanskrit manuscripts: the *Prajñāpāramitā*, written in Gupta characters; the *Vajracchedikā*, written in Brahmi characters; other writings dating from the 7th and 8th centuries; and, especially, numerous Chinese papers from 780 to 790. These dates are further confirmed by the discovery of Chinese coins of the K'ai-yüan (713–42) and Ch'ien-yüan (758–60) dynasties.

Stein has indicated the various structures by a letter followed by a number, since the names are unknown. The stucco reliefs consist of numerous fragments varying in importance, many of which once formed plaques decorating the upper walls. It is possible that, as at Rawak, many of these fragments were part of the decorative aureoles surrounding the principal images; they were made of clay, like the walls, and have completely disintegrated. Among the fragments found in the cella of Sanctuary D I, Stein identified various small figures of standing buddhas, seated bodhisattvas, and gandharvas holding garlands, as well as fragments of a flame design from an aureole and floral ornaments, such as lotus petals and vine scrolls; these decorative elements are clearly related to both Gandhara and eastern Iran (see INDO-IRANIAN ART). Stein also found small fragments of seated bodhisattvas in Sanctuary D II, where each corner of the cella was decorated with a draped stucco figure standing on a lotus pedestal. In a small adjoining room was a large, seated figure, of which the base alone remains, flanked on each side by lions, only fragments of their mane-curls

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

undestroyed. Fragments of aureoles made up of small buddhas and bodhisattvas were found, some still attached and arranged to follow the curve of a border, the edge of which was formed by series of overlapping lotus petals, alternately red and green. On the east wall there was a stucco statue of a figure dressed in chain mail reaching down to his knees and composed of alternating rows of red and blue and red and green links; he wears soft boots and is trampling upon the twisted figure of a demon. The head was found near the statue, which seems to be one of the four lokapalas adorning the corners of sanctuaries. Sanctuary D XII contained traces of some small reliefs which indicate that the decoration of the upper portion of the walls was composed, like that of D I, of different elements inspired by the art of Gandhara or eastern Iran, although it is impossible to tell how and from where these motifs arrived in Khotan.

While sculpture is poorly represented, murals and painted wood panels are among the most important examples of the art of this region and of all Serindia (PLS. 378, 379, 381, 383). Painting probably decorated all the interior cella walls not covered by the large reliefs of cult images, while the passages surrounding the shrines were decorated with frescoes on the inner walls. The cella of Sanctuary D I was decorated by a much damaged frieze formed by ranks of tiny buddhas and bodhisattvas differing only in color of dress and background. The large cella of Sanctuary D II had a broad frieze with lotuses and small worshipers above the statue. On the outer walls are narrow bands of frescoes with miniature bodhisattvas and arhats seated in meditation. On the south side was pictured a local legend that must have been quite popular, since it also appears on some of the wooden panels: three rows of youths, on horseback or riding camels, each holding in his outstretched right hand a cup toward which a bird is flying. In a small cella on the west side of Sanctuary D II were found the remains of a fresco in which some figures clearly show Indian influence (PL. 381). On the right there is a small image of a seated buddha wearing a dark reddish-brown garment and on the left, a youth seated near an older man whose hand is raised as if he were teaching. A female figure standing in a lotus-filled tank bordered by paving stones forms the most important part of the composition. The lady is nude and bejeweled; she wears four ropes of tiny bells and pearls around her hips and thighs. At her feet a small male figure rises from the water; farther left another male figure seems to be swimming, and in front of the tank is a riderless horse. This is probably a representation of the legend told by Hsüan-tsang about a widowed naga who asked the king of Khotan to provide her with a husband in exchange for her protection. This scene, in which the graceful female figure is treated as in Indian sculpture, must have been inspired by the paintings of Gandhara, none of which have survived, or by Gupta art. Stein also sees classical influences in the Venus-like pose and the leaf covering of the lady.

In Sanctuary D VI, the walls with their frescoes are preserved to a height of about 3 ft. Except for the wall with the door, the cella walls were occupied by three large figures, of which only the feet on lotus cushions and the lower part of the garments remain. Below the feet of the great central figure on the south wall can be distinguished the pedestal, around which is painted a lotus-filled tank with geese swimming in it. Two worshipers appear on each side of the pedestal. At the far right a male figure, dressed in a Chinese garment and with a coiffure like that of certain Yōtkan figurines, offers lotuses. At the far left there is a woman kneeling with hands folded in prayer. Sanctuary D X was decorated with simple murals of little seated buddhas, all alike, whose garments were either dark brown, red, or white. They appear on both the inside and the outside walls. Sanctuary D XII also contained murals that were badly ruined. There must have been on every wall, except the north, three life-size figures standing on lotuses and surrounded by aureoles. In the lower part, between two aureoles, a fully draped female figure, looking up, plays the lyre.

Panel paintings were found in some shrines and monastic dwellings. In Sanctuary D II three panels show, respectively, a dancer drawn in a free and lively manner, a Gaṇeśa (?), and a most unusual bearded figure with four arms, flanked by two figures on each side playing musical instruments. Two panels from Sanctuary D IV survive: one, a bust of a figure with the head of a rat, crowned; and the other, an upright, preaching buddha. There are two panels from Sanctuary D VI the larger of which shows ten seated figures, perhaps bodhisattvas. Three remarkable panels in good condition were preserved in an adjacent room of Sanctuary D VII. One shows two riders, the upper figure holding a cup in his right hand, toward which a wild duck swoops (PL. 383). Both riders have halos, which might indicate that they are holy figures in a local legend unknown at the present time (the legend is repeated in the frescoes of Sanctuary D XII and two panels from D X). The second panel is decorated on both sides. On one side appears a three-headed, four-armed divinity whose attributes suggest that this is a type of Śiva (PL. 379); on the reverse, there is a bearded, long-haired figure with four arms, holding in his hands symbols of unknown significance. The third panel is in very poor condition but shows a well-drawn bodhisattva seated on a low throne.

Other panels were found in Sanctuary D X. The most important recovery illustrates the legend concerning the introduction of sericulture to Khotan (PL. 378): a female figure, probably the princess of the legend, is shown wearing in her abundant black hair a gold diadem to which a maid is pointing. Between them is a kind of basket containing the cocoons which the princess is apparently protecting. Behind her is a loom, beyond which another figure, with a coiffure resembling that of the maid, appears, holding an instrument like a currycomb, similar to one found at Niya.

The stuccoes and frescoes show a mingling of influences difficult to determine or identify because of their complexity; but the problem becomes even more difficult with the painted panels, where later influences coming from India via Kashmir or from eastern Iran join local artistic traditions in which Gandharan and Chinese influences had long been at work.

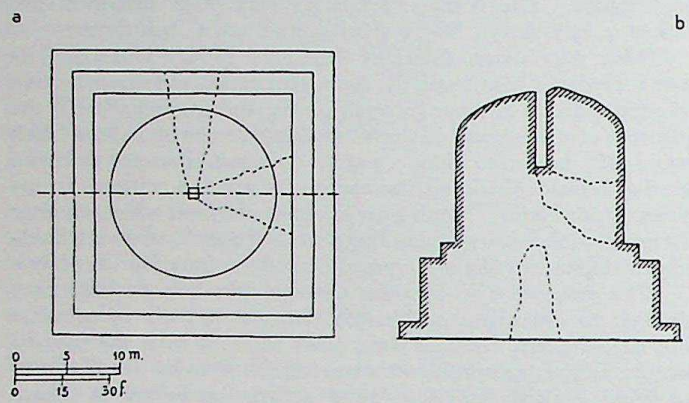
NIYA. The discoveries from Niya illustrate equally well the joint influences of China and Gandhara, but at a time earlier than at Dandan-uilik, since Niya was abandoned by the end of the 3d century, a date which more or less corresponds to the end of Chinese domination after the reign of Wu-ti. The small structure N XVI must have been a sanctuary of the Dandan-uilik type; it enclosed a square platform with a small semicircular plaster base which probably supported a cult image. Also included were two crude wooden statuettes in very poor condition. The most interesting objects were found within the dwellings. Besides the seals and intaglios mentioned above, of special interest are the furniture and textiles, which, together with the documents written in Chinese and Kharoshthi, show the preponderance of Indian influence. In the dwelling N III was discovered a carved wooden chair that had decorative motifs similar to those on Gandharan reliefs: four-petaled flowers inscribed within squares (PL. 382). The remains of two other carved chairs were found in N IV, the legs of one representing lion-headed monsters with horses' legs and winged bodies, and the legs of the other forming a pair of monsters with the head and shoulders of, respectively, a man and a woman, and with horses' hooves. One of the most distinctive textiles is a fabric that has bands of different colors with geometric decorations reminiscent of Indian models. Stein also discovered on the entrance wall in N III fresco remains in which bands of five-petaled flowers alternate with plain double rings; these two motifs, in red, were joined by a scroll ornament, composed of two crescents back to back, and can be compared to the same kind of motif found in Gandhara.

ENDERE. Farther east are the ruins of Endere which consist of a stupa (FIG. 999), an important temple near the center of a circular enclosure (part of its wall still stands), and housing for monks or for a defending army. In the sanctuary, similar to those of Dandan-uilik, Stein found plaster images almost completely detached from the walls and standing on a base in the shape of a reversed lotus blossom. Three of these images, partly preserved in the corners of the cella, seem to have been lokapalas. The drapery, similar to that used at Dandan-uilik, is clearly related to Gandharan models. The statues were

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

painted, but only the portions protected by the drapery folds have retained their color. Traces of frescoes that remain on the northeast wall depict a total of 14 buddhas or bodhisattvas seated in two rows. The workmanship on these seems to have been better than that at Dandan-uilik, and the colors are more delicate. The monastic dwellings E II included a small chapel; on its south wall was a fresco with a buddha or bodhisattva in the center (only his feet and the lower part of his garment remain). An oval aureole enclosing him bears little seated buddhas or arhats in red robes on a blue background. In the triangular spaces left at the bottom on each side are a praying figure and a standing figure holding a raised sword. A painted panel found on the floor in another room pictures a seated Gaṇeśa or Vināyaka with four arms, whose details are clearly Indian. Colored sketches on paper were also found; the liveliest shows a camel nursing her calf (PL. 378).



Endere, stupa. (*a*) Plan; (*b*) section (*from A. Stein, Ancient Khotan, Oxford, 1907*).

In addition to these major sites mention should be made of Kara-dong near the Keriya River and, somewhat nearer to Khotan on the east, Uzun-Tati, Tuga-dong, and Aktaz. Near Aksipil, with its fortifications, is Arka-Kuduk-Tim, Tati (1), and T'am-Öghil. All the foregoing sites are east of the Yurungkash River, on which Khotan lies. West of the river are Tati (2), Chalmakazan and Gośṛṅga, as well as the more distant Karadöbe, Karakir-Tim, Kallangar, and Togujal. Even further west are Kakshal-Tati and Tōpa-Tim.

The region of Khotan, the king of which was said to have reigned over seven cities during the T'ang dynasty, was an important center of civilization before its final destruction by the Moslem invasion. All its sites prospered for many centuries. Apparently most of the sites were abandoned at different periods: some, like Niya, in the 3d century, after the overthrow of Chinese domination in Central Asia; others, like Dandan-uilik and Endere, at the end of the 8th century, after the Tibetan invasion; and finally, still others, like Yōtkan, for undetermined reasons, the Moslem invasion being the most likely cause. Doubtlessly, after the various devastations, the inhabitants of Khotan could no longer maintain the water systems which were indispensable to life there and had to abandon their lands.

KHWARIZM. The Arabic name Khwarizm, found in Islamic sources, is a transcription of the classical forms (Gr., Χορασμίη; Lat., Chorasmia) derived from the ancient Iranian Huwārazmi (or Hwāirizem) of uncertain etymon. It has become the established custom among specialists to use this name in the sense and with the significance that Russian scholars attribute to the form Khorezm (derived from the Greek form). It thus refers to the successive cultures and civilizations of pre-Islamic times which flourished in the lower Amu Darya (anc. Oxus) basin and in the area of the Syr Darya (anc. Jaxartes) basin. A region traversed by the invaders from the East and already the seat of an organized state by the first half of the 1st millennium B.C., Khwarizm was later incorporated into the Achaemenid empire. By the time of Alexander the Great the region had again become autonomous and seems to have remained so until the Islamic conquest. Although influenced by the classical and Iranian West, Khwarizm developed an independent art culture whose originality lay above all in certain architectural characteristics, which were in turn a reflection of its particular economic and social systems (see ASIA, CENTRAL).

SUMMARY. Historical background (col. 1000). The Amirabad culture and the "culture of the villages with wall dwellings" (col. 1000). The Kangyu period (col. 1002): *The fortresses with rectangular enclosures: Dzhanbas Kale; The fortresses of circular plan: Koy-krylgan Kale.* The monuments contemporary with the Kushan period (col. 1005). The Kushano-Afrigidian period: Toprak Kale (col. 1006). The Afrigidian period (col. 1007). The Afrigid-Samanid period (col. 1008). The period of the Khwarizmshāhs (col. 1009).

HISTORICAL BACKGROUND. During the first half of the 1st millennium B.C., the peoples of central Asia (the regions lying between the Caspian Sea and the chains of mountains bordering northern Asia) constituted a complex population of related tribes speaking a variety of Iranian languages (see ASIA, CENTRAL). Some led a sedentary life based on agriculture; others remained in a nomadic state, deriving their livelihood from cattle breeding supplemented by hunting and fishing. It is difficult to determine the territorial limits of each group, for the nomads probably lived in close contact with the sedentary population.

The nomadic peoples were called Scythians by the Greeks and Śakas by the Indians. In the 2d century B.C. they invaded a part of the Iranian world and, like the Yüeh-chih, or Tocharians, one of whose tribes founded the Kushan empire (see KUSHAN ART), were finally absorbed into the sedentary population. Descended from the same stock as the Indo-Europeans, this population was eventually replaced by the Turks, after the collapse of the Hsiung-nu empire and the gradual advance from the Siberian region of ethnic groups that were ancestors of the Huns and of various tentatively identified peoples called Kidaras and Ephthalites. The arrival of first the Turks and then the Mongols led to the almost total destruction of the sedentary civilizations, which had already lost their distinctive characteristics in the course of their conversion to Islam. The invaders of Khwarizm disrupted not only the culture but also the very way of life, which was oriented to an agriculture based essentially on the irrigation of regions threatened by the progressive drying up of central Asia. Certain regions managed to survive, but most areas, as a result of the systematic destruction of the irrigation network and the massacre of a part of the population, ceased to be cultivated and reverted to desert.

THE AMIRABAD CULTURE AND THE "CULTURE OF THE VILLAGES WITH WALL DWELLINGS." Of those centers of sedentary civilization which were extensions, more or less, of Iran on its borders, the most remarkable was Khwarizm. The population gradually became concentrated in several locations which grew into towns. The development of this region was due essentially to its irrigation; intelligent tapping of the middle course of the Amu Darya and of its delta at Lake Aral made possible the irrigation of considerable areas of land. Research by S. P. Tolstov has shown that the irrigation system in Khwarizm must have been created between the 7th and 6th centuries B.C., though the manner in which it gradually evolved remains a mystery. There can, however, be no doubt that the realization of such an important project took centuries, requiring the determined effort of a large population of considerable means. Archaeological documentation and the Arab geographers furnish no more than legends; only the Achaemenid period (see IRANIAN PRE-SASSANIAN ART CULTURES) provides a firm historical basis on which to study the archaeological data. All that is known of this remote period is that the inhabitants of Khwarizm had a variety of implements at their disposal — agricultural tools, in particular, fashioned mainly of iron — and that they produced a coarse black or gray-black pottery with a herringbone pattern. Ac-

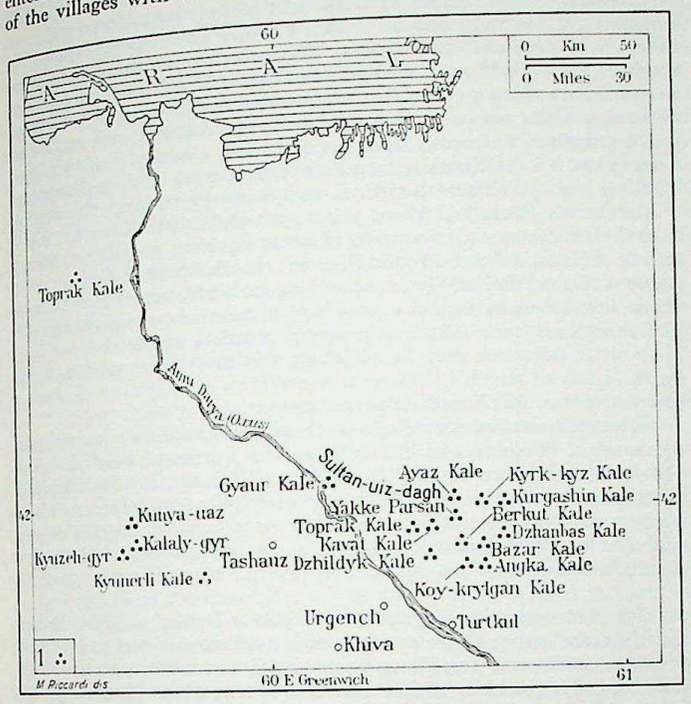
cording to Tolstov, this civilization was akin to that of the Massagetae, who lived in the north, and he has named it the "Amirabad culture." It apparently developed toward the end of the 2d millennium B.C. and lasted about four centuries. It is at this point that Khwarizm enters history and that the civilization called by Tolstov the "culture of the villages with wall dwellings" existed (6th–4th cent.).



Khwarizm (Uzbekistan). *Key*: (1) Archaeological sites.

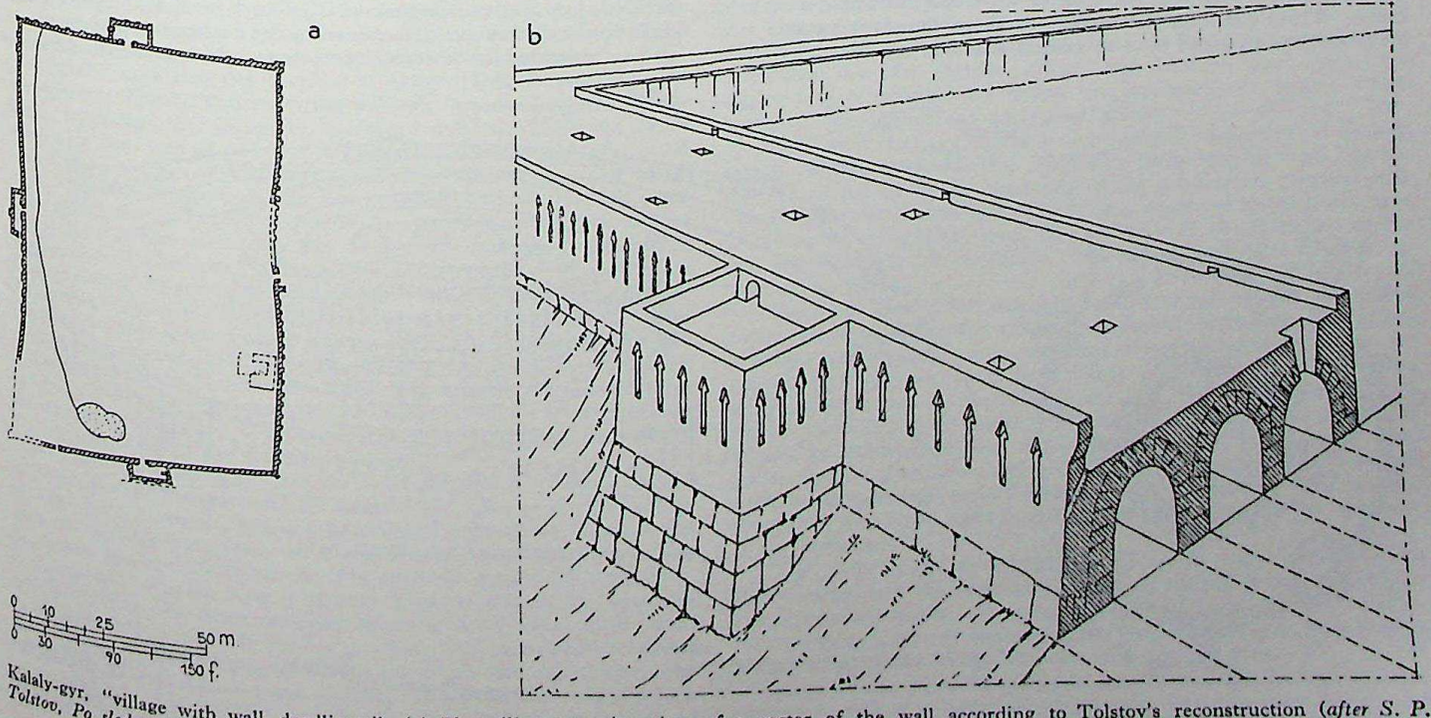
The rise of this civilization, which was certainly materially advanced, coincided roughly with the founding of the Achaemenid empire by Cyrus. At this time, the future Khwarizm must have presented a somewhat unusual picture, certain regions having already reached quite a high level of civilization, while others had remained at a rudimentary economic stage (cf. Herodotus, I, 202, on the sedentary population of the lower Oxus basin). The lower Syr Darya was inhabited by a sedentary population with rather important settlements in the Dzhety-Asar region. This seems to have been an original civilization in which cattle breeding and agriculture played major roles, as is attested by the numerous cereal graters and animal bones found in the lower strata of one of these sites. (Handmade pottery of high quality was also discovered.) Tolstov is inclined to regard this population as the ancestors of the Tocharians, mentioned at a much later date by Ptolemy in his geographic work. Thus, the deltas of both rivers were inhabited by more or less civilized, sedentary people. No important centers of civilization developed in this area, however, since the settlements of the lower Syr Darya were exposed to the attacks of nomads and were isolated from the other cultivated regions by the desert. In contrast, the centers along the lower Amu Darya, well protected and in communication with those of northern Iran, flourished and constituted a remarkable focus of civilization, which finally collapsed only before the onslaught of the Mongols.

The "culture of the villages with wall dwellings," as it was discovered at Kyuzeli-gyr and at Kalaly-gyr (FIG. 1001), is characterized by enormous, generally rectangular edifices, each built around a large empty space resembling a vast courtyard (in which the cattle may have been kept). Massive walls divided each edifice into two or even three passages in which the inhabitants lived. Light and air entered and the smoke from the fires escaped through apertures — pierced at irregular intervals in the vaulted ceilings of the passages — which opened onto a flat terrace roof. The upper part of the much thicker and higher outside wall, which formed a parapet around the terrace, was pierced with loopholes from which the area could be defended; a series of towers flanked the exterior of the complex and four entrances opened from the outside onto zigzag passages.

This type of habitation would appear to derive from those of the Amirabad period. The small number of objects found here includes coarse pottery turned on a wheel and decorated with horizontal fluting (reminiscent of that on Achaemenid metal vases) and vases coated with a red slip. Also found in the excavations were three-bladed arrowheads differing from the leaf-shaped, socketed specimens of the preceding period (8th–6th cent.), when Scythian influence had predominated. To this scanty material must be added the fragmentary remains of a few coarse clay statuettes representing animals and what must have been a female divinity, perhaps a prototype of Anahita.

These vast constructions would appear to be comparable to those described in the Avesta, though our limited knowledge prevents the drawing of any definitive conclusions.

THE KANGYU PERIOD. Tolstov calls the following period (4th cent. B.C.–1st cent. of our era) the "Kangyu period." Kangyu (or Kankju) is the Russian transcription of the Chinese name K'ang-ch'ü, given to a group of nomads who, according to Chinese historians, roamed the territory to the northwest of the Wu-sun; the Chinese transcription apparently corresponds during this period to the theoretical reconstitution *Kangkio (*indicates a hypothetical word form). Tolstov seems to infer that Khwarizm was included in this nomadic state, or, at any rate, came within its sphere of influence; however, that Khwarizm, a stably organized and well-defended center of civilization, should have escaped conquest by Alexander, only to become



Kalaly-gyr, "village with wall dwellings." (*a*) Plan; (*b*) perspective view of a sector of the wall according to Tolstov's reconstruction (*after S. P. Tolstov, Po sledam drevniekhorezmskoi tsivilizatsii, Moscow, 1948*).

UP State Museum, Lucknow

a tributary of a nomadic confederation probably composed of Scythian tribes, hardly seems likely. It is more probable that any relations between the two groups were purely commercial. (The K'ang-ch'ü appear to have occupied the territory between Lake Balkhash and the banks of the middle course of the Syr Darya during the period to which Tolstov attributes their greatest expansion.) With the scanty data available, it is impossible to make any definitive affirmations.

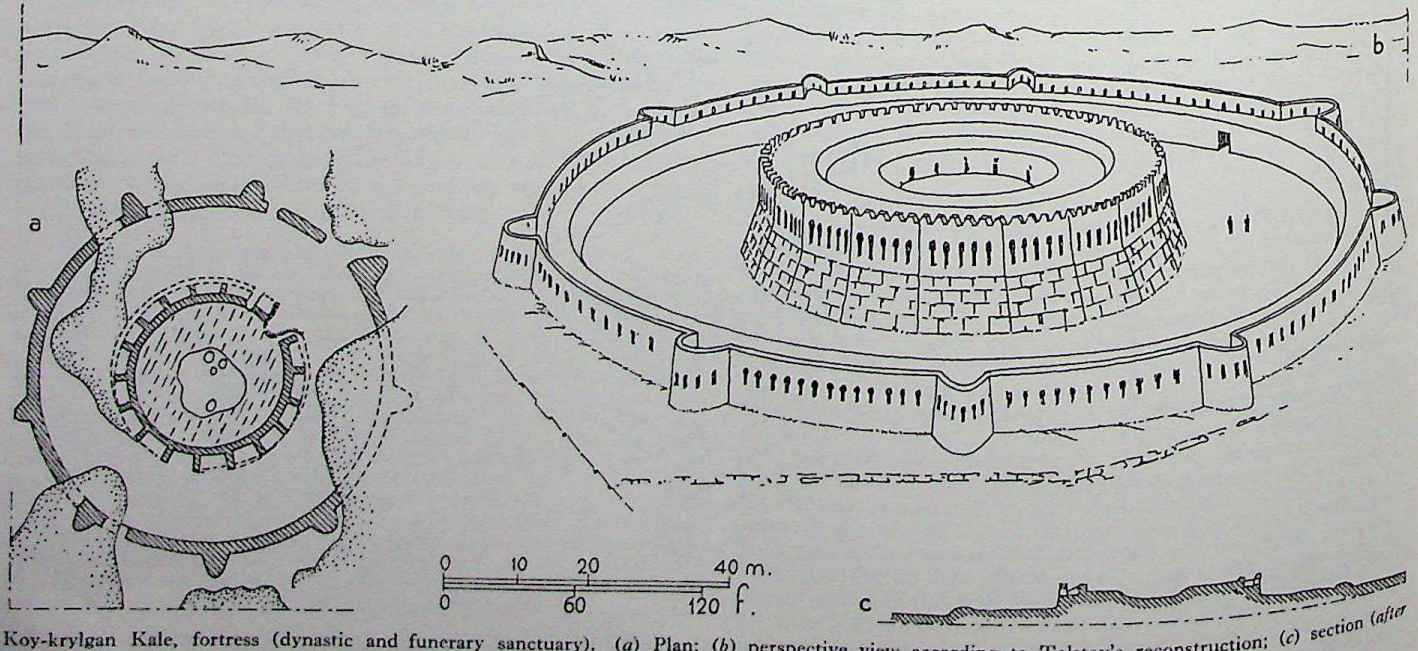
Whatever name may justifiably be given to the period lasting from the 4th century B.C. to the 1st century of our era, Tolstov's discoveries have made it possible to distinguish two groups of monuments from among those he has discovered: the earlier specimens date from the period that preceded the founding of the Kushan empire, the later ones from the beginning of the Kushan epoch, which lasted from the 2d to the 4th century. The excavations carried out at Ayaz Kale, Toprak Kale, Dzhanbas Kale, Gyaur Kale, Kunya-uaz, and Koy-krylgan Kale — to mention only the most important locations — have led to the discovery of abundant documentary material and, in particular, of ceramic ware from which it has been possible to date these sites (PL. 385). Tolstov divides this ceramic ware into four categories. Two groups comprise pieces turned on a foot wheel: the first consists of jars with rolled upper lips decorated mainly with triangular motifs in red or black, goblets with disk-shaped feet, and pitchers covered with a black glaze — all made of a smooth, well-baked red paste and sometimes coated with a red slip or glazed red; the pieces of the second group are covered with a red glaze and closely resemble the pottery discovered at Tali Barzu (south of Samarkand) and at Airtam (near Termez), where coins of Kaniṣka (2d cent. of our era) were also found. The third group consists of pieces adorned with an incised design of triangles and painted red over a yellow foundation, which apparently show a certain affinity with the local pottery of the "villages with wall dwellings." The fourth group comprises handmade gray pottery, which appears to be comparable to that discovered in the necropolises (dating from about the beginning of our era) attributed to the Wu-sun of Kirghizstan and eastern Kazakhstan.

These sites are the first that have been found to contain a considerable number of coins; some have yielded only Khwarizmian coins bearing the royal effigy crowned with a helmet in the form of an eagle. By means of the Kushan coins of the 2d century, which were scattered in large numbers throughout the regions bordering the Kushan empire and recovered at even the most recent sites, it has been possible to date even the latest monuments, certain of which may have existed as late as the 3d or 4th century (since Kushan coins of this date have also been found). These sites have also yielded such objects as beads of polychromed glass, of the same type as those found on the shores of the Black Sea, which date from the 3d century B.C. to the 2d century of our era. In addition, a certain number of rather coarse clay figurines, which, since they are flat, must have been cast in a single mold, have also come to light: at Dzhanbas Kale were found a man's head, the torso of a male figure dressed in a short jacket, a horse's head, a lion's head, and a fragment of an earthenware vessel decorated with animals in relief; and at Kurgashin Kale there was a fragment with a feline in relief. These figurines correspond to those found at various sites in Sogdiana (q.v.) and even in central Asia and northwestern India. According to Tolstov, the majority of those found at Dzhanbas Kale date from the 4th century B.C. to the 1st century of our era and can be divided into three groups. The first group, from the Achaemenid period, comprises figurines of women dressed in long garments with embroidered edges, holding their left hands against their breasts. A second group, probably dating from approximately the second half of the 3d to about the 1st century B.C., includes numerous male and female figurines reminiscent of the work of Parthian coroplasts: the men are dressed in shirt jackets fitting tightly at the waist, baggy trousers, and headdresses of Phrygian type with ear flaps, the women in gowns over long petticoats with shawls over their shoulders. (This dress resembles not only the costume in which the Khwarizmians are portrayed on Achaemenid relief carvings, but also that known to have been worn by the Scythians and the inhabitants of Asia Minor and Thrace, and even that of certain personages figuring in the frescoes of the Tarim Basin.) A third group, which Tolstov dates no earlier than the 1st century B.C., consists of larger figurines including male and female figures draped in mantles or shawls, female figures either posed like the Medici Venus or riding animals, nude male figures, and a few others seated in a pose reminiscent of certain examples of Gandharan art (see GANDHARA). A few intaglios which seem to show Hellenistic influence may be added to this assortment of documents, on the basis of which it has been possible to classify sites that are of interest, above all, for their architecture.

The architectural complexes on these sites are of quite considerable dimensions. Tolstov and his collaborators attribute those of Dzhanbas Kale, Kyrk-kyz Kale, Koy-krylgan Kale, and Kyunerli Kale, to mention only the most important, to an early phase, namely to the Kang-yu period. He regards these fortified complexes as independent and exclusively Khwarizmian architecture, owing nothing to the ancient East. Whatever their origins, they are of two different types.

The fortresses with rectangular enclosures: Dzhanbas Kale. Dzhanbas Kale is a vast rectangular complex consisting essentially of a double fortified wall measuring about 605 × 525 ft., with two stories of loop-holed galleries, within which rose two blocks of buildings separated by a wide street; the entrance, located at one end of the street, was protected by projecting structures measuring about 65 × 170 ft., which formed a staggered passage. Both blocks consisted of adjoining dwellings; the only isolated building was a "house of fire," which stood at the opposite end of the street, facing the entrance way, and contained a sanctuary and a room that served, according to Tolstov, as a communal dining room. Several other sites, of the same plan but, apparently, of later date, are Gyaur Kale, consisting of a vast irregular rectangular complex with several rows of rooms forming a single unit with the wall; Kunya-uaz, where the enclosure is divided in two by a wall that rises opposite the entrance to the sections; and Kyunerli Kale, where an enormous keep stood in the center of a square enclosure.

The fortresses of circular plan: Koy-krylgan Kale. A highly original plan characterizes such other fortified complexes as the little castle of Kyrk-kyz and the fortress of Koy-krylgan Kale. Kyrk-kyz is of an irregular oval shape (determined by the configuration of the ground) and is protected by a second enclosure, which is in the form of a



Koy-krylgan Kale, fortress (dynastic and funerary sanctuary). (*a*) Plan; (*b*) perspective view according to Tolstov's reconstruction; (*c*) section (*after S. P. Tolstov, Po sledam drevniekhorezmskoi tsivilizatsii, Moscow, 1948*).

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

segment of a circle and is linked to the central fortress by two more or less perpendicular walls bordering the platform on which the whole complex is built; the entrance was located in the middle of the outside wall. The same type of circular fortification is found at Koykrylgan Kale (FIG. 1003; III, PL. 484), where a vast circular enclosure surrounds an enormous citadel of the same shape. This complex consists, in effect, of a massive circular wall about 195 ft. in diameter, which is flanked by nine evenly spaced towers, pierced with loopholes all the way around, and provided with a broad rampart walk and a single entrance. The citadel is in the form of a vast regular polygon with 18 sides; the walls, rising considerably above the outer enclosure, are pierced with loopholes near the top and surmounted by serrated crenelation. The outer enclosure is entered by way of a covered gallery, above which runs the rampart walk giving access to the battlements. The interior is taken up by a circular edifice forming a single unit with the inside wall of the fortress, and a courtyard of the same shape is located in the center of the citadel. This completely original complex with its towers foreshadows the fortifications of the Kushan period, when the great fortified sites were to undergo further transformations. These fortresses, which had sheltered entire clans, were gradually replaced by others of lesser dimensions, which were inhabited by families descended from the clans.

THE MONUMENTS CONTEMPORARY WITH THE KUSHAN PERIOD. The architectural monuments that may be regarded as contemporary with the Kushan period, such as Ayaz Kale, Dzhildyk Kale, Angka Kale, Bazar Kale, and Kurgashin Kale, differ markedly from those of the preceding period. Fortress 1 of Ayaz Kale, built on a high cliff, has massive walls which are provided with galleries for archers, reinforced by semicircular towers, and dovetailed at the corners. The fortress, dominating the site on which it stands, is small in comparison with such earlier constructions as Fortress 3 of Ayaz Kale, at the foot of the cliff, the ruins of which show a staggered entrance and spacious courtyards surrounded by baked brick walls, against one of which a few dwellings have remained standing. The difference in size of the two fortresses (Fortress 1 measures about 655×490 ft.; Fortress 3 is about 850×590 ft.) indicates that during the Kushan period there was a transformation in the way of life paralleled by a profound modification of society. Henceforth, families, instead of clans, inhabited these complexes, in which the fortress represented the families' residence and the outbuildings the dwellings of those whose job it was to look after the families' property. The fortress of Kurgashin Kale, of lesser dimensions (ca. 460×330 ft.), has a more elaborate system of defense, including oblique loopholes, two adjacent towers, and even two abutting towers which form a dovetail on the southeast corner. Bazar Kale is a square complex, each side measuring about 1,870 ft., with a thick wall reinforced by more or less evenly spaced towers, two of which guard its entrance, and with a redoubt of modest dimensions on the northeast corner, which has a zigzag entrance. Angka Kale, measuring about 260×280 ft., is also a square fortress; it has a double wall pierced with loopholes and reinforced by massive square corner towers reached by narrow passages. The main entrance, guarded by smaller towers of the same type, is located in the middle of one of the sides; this fortress probably also included a central redoubt.

The far more complex fortress of Dzhildyk Kale was built on steeply rising ground and provided with an improved system of defense. As in the other fortresses, the outer wall was reinforced by an inner wall, but, instead of being vertical, the outer wall was erected with sloping sides and reinforced by massive buttresses. The occupants were thus able to dominate any assailants or to defend the place more effectively and with a minimum of risk. Moreover, four corner towers built in the same way provided a further reinforcement for this outer wall, the upper part of which was occupied by a rampart walk protected by serrated crenelation, while a passageway under the terrace enabled the defenders to reach safely any threatened areas. The fortress was entered along a ramp leading to an entrance in one of the corner towers, through which, in turn, led the sole passageway to the interior of this fortified structure. The central redoubt consisted of a keep, provided with casemates and surmounted by a battlemented terrace, which occupied a corner of the inner court and rose above the rampart walk of the outer enclosure.

It has been possible to date the various fortresses from a certain number of objects discovered on these sites. One of the complexes at Ayaz Kale, however, has not been dated definitively, because the coins found here were from the era of Kaniṣka, and the dates of his reign have not been determined. The ceramics recovered here, however, are of the same type as pottery found elsewhere and approximately confirm the dates assigned to Ayaz Kale; other finds, such as necklace beads, provide further confirmation, since they resemble those found in the regions bordering the Black Sea dating from the 1st to the 3d century. A bone stiletto, with a handle shaped like a hand, three-bladed bronze arrowheads with sockets, fragments of alabaster vases with representations of female figures, and bronze earrings and pendants (perhaps amulets, since they represent animals) have also been brought to light at Ayaz Kale, while a fragmentary torso of a statuette probably representing the Egyptian god Bes was found at Bazar Kale.

Khwarizmian pottery, like that of the other Central Asiatic regions during the centuries prior to and following the dawn of the Christian Era, is often characterized by a red slip, glaze disposed in bands, and a design of undulating lines; the most recurrent types are vessels in the form of jars, wide-necked bottles with feet, and vases with handles in the form of animals. In addition to these, however, Khwarizm produced more distinctive ceramic ware, such as large wine jars and vessels adorned with a painted design of spirals linked by circles; wide use was made of glaze, which was applied not only in bands, but also in crisscross patterns and even over the whole surface.

THE KUSHANO-AFRIGIDIAN PERIOD: TOPRAK KALE. Tolstov has named the following period Kushano-Afrigidian, after the dynasty that ruled independent Khwarizm upon the dissolution of the Kushan empire. This was a period of transition, during which Khwarizm entered upon what may without exaggeration be called its medieval period and developed a feudal system. Society underwent further sweeping transformations, which were expressed through modifications in architecture as well as in the other fields of art and in technique. The most noteworthy of the architectural complexes attributed to this period are Toprak Kale and the less important sites of Yakke Parsan and the small Kavat Kale.

Of all the architectural monuments of Khwarizm, Toprak Kale (PL. 389) is perhaps the most important. It is a princely city and was perhaps the residence of the rulers of Khwarizm. Its discovery by Tolstov has yielded not merely another architectural ensemble and a few archaeological documents which allow an estimate of the degree of civilization attained here, but a city whose successful excavation and reconstitution, carried out with extreme competence by Soviet archaeologists, has yielded remarkable archaeological documentation on the arts of painting and sculpture.

Toprak Kale is a rectangular complex of about 1,910×1,380 ft. surrounded by a wide ditch spanned by a bridge leading to a fortalice attached to the fortified outer wall, which constitutes the entrance to the city. The rectangular outer wall is reinforced by evenly spaced square towers and flanked at the corners by larger square towers; the walls and towers, built on inclined foundations, are pierced with elongated loopholes and surmounted by crenelation. The city itself consists of two blocks of houses divided into wards by lateral streets joining at right angles with a central avenue which runs between the entrance and a fortified palace located in the northwest corner of the city. This palace, built on a high platform, comprises a spacious courtyard, terraces, an entrance ramp, and a sizable main building flanked and dominated by three massive square towers (PL. 389). Another group of buildings surrounds a rectangular space filled with ashes which must have been a "house of fire." This space is in the center of a vast rectangular courtyard which, although slightly more to the west, constitutes an extension of the central avenue.

This plan shows the same characteristics as that of the towns of the preceding periods, such as Dzhanbas Kale, with the notable difference that the façades, which had hitherto been plain, are adorned with pilasters separating the loopholes — a feature which persisted throughout the Afrigidian period.

The lowest strata at Toprak Kale contained material of the Kushan epoch, higher strata afforded Afrigidian coins ranging from the beginning of the 3d to the beginning of the 4th century together with coins of Vāsudeva (first half of 3d cent.), while the upper strata have yielded only Afrigidian coins, the most recent of which are of the late 5th and early 6th centuries. The objects found on this site are thus amply dated.

The main part of the palace consisted of two stories of vaulted rooms; those in the center, richly decorated with sculpture and paintings (PLS. 386–388, 390), were the great reception rooms. Cut into the walls of one of these rooms were niches which contained clay statues representing crowned personages; another room was adorned with images of rulers or divinities and dark-skinned warriors, as well as reliefs, probably depicting a hunting scene, of trees, rolled vine leaves, cervine creatures, and griffins. The living quarters, adorned with mural paintings, were located to the south of the central section; the public buildings, including the workshops, were on the west side of the structure.

The pictorial and sculptural remains are of major interest. Both the paintings and the sculpture are closely related to the architecture and, characteristically, the sculpture (whether high or low relief or statuary) was generally polychromed; true statuary was, moreover, a rarity, most statues being left unmodeled at the back.

Most of the pictorial remains, known through Tolstov's publications, consist of no more than fragments, found in the rubble, which had fallen from the walls (PL. 390); the odd fragments still in place

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

are apparently in very poor condition. M. A. Orlova has made a study of the principles which governed the internal disposition of these pictorial compositions. The first and most widely applied consists in dividing the wall surface into circumscribed decorative panels, each about 3 ft. high, and filling in the space above them with random ornamentation on a smaller scale or with a representational painting. Another procedure is that of alternating decorative motifs and representational paintings at random over the entire wall surface, while a third consists in interspersing an over-all decor of painted garlands and symbolic designs with portraits framed in ornamental motifs.

Judging from the available information, sculpture appears to have predominated in the interior decoration, but always in conjunction with painting; the pieces of sculpture were executed in unbaked clay and coated with a thin layer of plaster (the base of which was powdered alabaster), which constituted the foundation for the paint. This polychrome sculpture stands out clearly from the painted background of the wall surface and, as Tolstov observes, is characterized by the constant repetition of groups of an identical type, emphasizing the internal structure of the room.

Because of their ornamentation, three of the reception rooms have been named, respectively, "Hall of Kings," "Hall of Victories," and "Warriors' Hall." According to Tolstov, the sculpture in the Hall of Kings was placed in niches, each containing a group representing a ruler of Khwarizm surrounded by the members of his family (the latter of comparatively lesser proportions). These groups were evenly distributed around the walls and separated only by thin partitions of brick openwork; the whole resembled a portrait gallery featuring the monarchs who reigned during the first centuries of our era.

The groups executed in high relief in the Hall of Victories were also arranged in niches, and all represented the same female figure (perhaps the goddess of victory) dressed in a thin, billowing gown standing with her face turned toward a seated personage of princely aspect (PL. 387). The Warriors' Hall was decorated with a series of ornamental motifs (resembling those on Ionic capitals) alternated with the repeated representation of a male figure turned to the left, and the remainder of the wall surface above these motifs was occupied by reliefs of dark-skinned warriors executed on a smaller scale (PL. 386).

The secondary halls and chambers, together with the corridors, were adorned with a variety of either purely ornamental or representational paintings. Noteworthy among the fragments of figural painting are a woman picking fruit, two figures adorning a niche in Room 25 on the first floor, and, particularly, a female harpist in Room 25 on the second floor; two fragments of female heads also deserve mention. The female harpist, whose face is partially destroyed, is vaguely reminiscent of the female harpist of the Airtam frieze; the painting is executed in a yellow tone, and the elegance of the drawing and the acanthus leaves seem to reflect distantly the art of Gandhara. In contrast, the fragmentary full-faced portrait of a woman is reminiscent of the style of the Syro-Egyptian paintings of the Roman period, and even of that of the paintings in the catacomb at Kerch, of the same period. These two fragments would seem to reveal that diverse artistic influences probably penetrated Khwarizm, constituting, as it did, one of the junctions on the network of caravan routes linking the eastern Mediterranean and the northern shores of the Black Sea to central Asia and India.

The remaining fragments seem to differ in both color and style from those described above and may perhaps be regarded as the products of an original, local art. In addition to these extremely precious, but rare, fragments, there have been found a certain number of others with decorative geometric or plant motifs, many of which seem to correspond with the contemporaneous popular art of Central Asia (see ASIA, CENTRAL).

Toward the 5th or 6th century, Toprak Kale began to show signs of a decadence that was manifested chiefly in the minor arts (e. g., pottery became coarse and ceased to be turned on a wheel). The town itself was gradually abandoned and, by the 7th century, had become a necropolis.

THE AFRIGIDIAN PERIOD. The sites of the small Kavat Kale and Yakke Parsan already belong to the Afrigidian period and are of an entirely different plan. In each case, the whole complex is laid out in a plan of two or three concentric squares, with the keep in the center instead of in the corner, and the courtyards disposed in terraces; moreover, while the walls of the central redoubt continued to be built of small, baked bricks, the outer walls were henceforth of mud and no longer provided with the loopholes characteristic of the preceding period. (The inhabitants assembled on top of the walls to defend the castle, with only the battlements to protect them.) This was a considerable modification, for, during the Kushan period, large, square, unbaked bricks had constituted, as in the past, the principal building material for both the supporting walls and the vaulted roofs; the Khwarizmians, like the inhabitants of Sogdiana (Transoxiana), rarely had recourse to stone, which was used only for the bases of the columns supporting the roofs of certain chambers. Though the small Kavat Kale appears to be the earlier of the two complexes, the castle of Yakke Parsan is the more interesting. The central keep with its festooned and battlemented walls is built on a foundation with sloping sides and is linked to the inner enclosure by a bridge leading to the entrance, which is guarded by two massive round towers. This rectangular inner enclosure, reinforced by four massive round corner towers and by two towers along each side, rises above a second enclosure, forming a vast quadrilateral with rounded corners and provided with only two towers guarding its entrance, which in turn dominates and is reinforced by a much larger outer enclosure with an unfortified entrance.

The Afrigid period lasted approximately from the 4th century until the start of the Arab conquest and even until the founding of the Samanid dynasty (which originated near Balkh and ruled Transoxiana and Khwarizm between 875 and 999). It was during this period that feudalism became firmly established, superseding the village system on which the ancient urban civilization of Khwarizm had been based. The region enjoyed a certain economic prosperity in the fields of agriculture and cattle breeding, and castles of varying sizes rose everywhere to house the big and small landowners, each of whom commanded numerous serfs. It was mainly the serious disorder accompanying the evolution to feudalism which prompted the modification of the plan of the castles that were the feudal lords' defense against opponents or invaders. These defenses, however, did not prevent the triumph of the Arab invasion.

The group of monuments most characteristic of this period is that of Berkut Kale, which extends for about 15 miles beside an old canal north of Turtkul. Of the more than 90 archaeological sites in this area, the most important are Teshik Kale, Berkut Kale, and Kumbaskan Kale.

Teshik Kale, a powerfully fortified complex, has an outer enclosure of mud, measuring about 45 × 320 ft., with oval corner towers and a staggered entrance; the inner enclosure has equally high but less massive walls. The wall facing the entrance to the outer enclosure ran through the keep. This keep, reached by a drawbridge, is built on a foundation with sloping sides which are 25 ft. high; its upper structure, built of small bricks, forms a rectangular block of festooned and crenelated walls decorated with a blind arcade with engaged columns, each adorned with three blind loopholes. The interior consisted of rooms opening onto a passageway, of which two on the right were reception rooms. The smaller was adorned with a terra-cotta frieze, the larger with a frieze of unbaked clay of rosettes with eight petals and palmettes with five leaves (PL. 389); a back room contained large jars. The ceramics, very different types from those of the early period, include large jars with incisions around the neck, potbellied pitchers with narrow bases, and vases with two handles and wide necks. Found with the ceramics were three impressions made with seals in clay; one represents a horseman shooting at an ibex and the other two, showing the influence of Greco-Buddhist art, a female divinity with four arms. Pieces of woven materials and such small objects as a double comb have also been brought to light, together with pre-Islamic coins, iron arrowheads with three blades, and rings set with round stones instead of the oval stones of earlier periods.

Berkut Kale consists of only a fortress with a keep in one corner and a square enclosure fortified by towers at the corners and along the sides; the whole, together with the few scattered remains of the town itself, was surrounded by another, irregular enclosure.

At the site of Kumbaskan Kale, which appears to be of later date, there is a fortress with a double enclosure; the outer enclosure, measuring about 490 × 655 ft., is reinforced by oval corner towers and by two towers on one of the shorter sides, and the entrance was flanked by square towers in the form of pylons. The inner enclosure, which takes up a large part of the area protected by the outer enclosure, had in front of it a spacious courtyard, with a few secondary buildings which faced the outer entrance; an inner gateway opening onto the outer entrance was defended by a square tower in the form of a pylon and by the keep. This inner enclosure measures about 410 ft. on each side and is fortified by four oval corner towers and by three towers along three of the sides. (On the side facing the courtyard there is a single tower reinforcing the defenses around the entrance.)

THE AFRIGID-SAMANID PERIOD. The following period (9th–10th cent.), which Tolstov calls Afrigid-Samanid, was a time of transition. Whereas Moslem influence tended to dominate ornamentation, the architectural principles of the preceding period, with modifications, prevailed. Of the castles of Buran Kale, Castle 2 differs but little from those of the Afrigidian period, while Castle 1, like those of Naib Kale, shows the characteristics of the Moslem medieval period of Khwarizm. These fortresses are far less imposing than those of the Afrigids. Rectangular in plan, they have festooned walls reinforced at the corners by identical square towers and by other towers, one in the middle of each side; the gateway, also located in the middle of one of the sides, is defended by two towers shaped like pylons.

1009

THE PERIOD OF THE KHWARIZMSHĀHS. The following period, that of the Khwarizmshāhs (rulers of Khwarizm), is perhaps best represented by the complex of Kavat Kale, north of Turtkul. The feudal organization of this complex is demonstrated by the existence of a large castle, that of Kavat Kale, the residence of the feudal lord, who also owned several smaller castles inhabited by his vassals and an agglomeration of nearly ninety farm buildings or peasants' dwellings. Moreover, with their scant defenses, slender walls, and towers that look more like turrets, these castles are clearly the architecture of a peaceful period; certain architectural features of the preceding period have been voluntarily preserved, although, since the defense of the region was ensured by the ruler and his army, they no longer served any military purpose. A certain number of nonfigural ornamental motifs recovered on this site show the Moslem influence which gradually came to prevail in Khwarizm. Among the fortresses of this period, mention should be made of that of Kyz Kale, an edifice of imposing dimensions, 1,380×590 ft., which dominates the right bank of the Amu Darya upstream from Turtkul. Of irregular plan, its crenelated enclosing wall, though reinforced by round, oval, and triangular towers, is not so high as those of the preceding periods; its defensive value, despite the reinforcement of the gateways, is thus considerably reduced.

The fortress of Dzhanpyk Kale, on the right bank of the Amu Darya between Turtkul and Nukus, presents the same characteristics.

Louis HAMBIS

Illustrations: PLS. 385–390; 3 figs. in text.

KIRCHNER, ERNST LUDWIG. German expressionist painter and graphic artist (b. Aschaffenburg, May 6, 1880; d. Davos, Switzerland, June 15, 1938). Kirchner was the son of a paper expert. During a study trip to Nürnberg in 1898 he was attracted to the work of Dürer and of other early German woodcut artists. In 1901 he went to Dresden to study architecture. He also painted on his own with another architectural student, Fritz Bleyl, and, in 1902, began to etch. During 1903–04 he attended art school and then went back to architecture school, where he met Erich Heckel, who joined him and Bleyl in the study of art. The three young men worked in a store that Heckel had converted into a studio. In 1904 Kirchner saw a neoimpressionist exhibition and began to work in that style; he was also influenced at this time by medieval German art and Japanese prints. That same year his discovery of African and Oceanic art in the Dresden Ethnological Museum was an important step toward his future primitivistic leanings and those of the Brücke group he was to lead.

Kirchner's earliest works, especially his drawings and graphics, show a high degree of originality but also betray strong Jugendstil elements and the influence of Edvard Munch's cursive linear sweep and flat color areas. These sources, together with the flat brilliant areas of Félix Vallotton, contributed to the generally decorative and two-dimensional character of Kirchner's early art.

In 1905 another architectural student, Karl Schmidt-Rottluff, joined the group, and the Brücke was organized. In 1906 they added the Germans Emil Nolde and Max Pechstein, the Swiss Cuno Amiet, and the Finn Axel Gallén-Kallella and held group shows in Dresden-Löbtau. During the summers of 1907–09 the group worked on the Moritzburger Lakes, studying the nude in nature, and during the winters they worked in the studios of Heckel and Kirchner (V, PL. 211). At this point Kirchner's art was still more postimpressionist than expressionist; as the influence of Van Gogh made itself increasingly felt in the group, Kirchner's color became more spatulated and expressively brilliant. Although his art was so much under French influence, Kirchner and his group, unlike the Fauvist painters, leaned toward a Munch-derived erotomania with symbolic representations of men and women seen together in various circumstances. Kirchner, never content with a "form for form's sake" presentation, preferred to convert the form of visible nature into a symbol of life itself.

In 1910 Kirchner met Otto Müller (Mueller), the final recruit to the Brücke group. That year Kirchner was responsible for the group's annual subscriber's portfolio of graphic works. In 1911 he moved to Berlin with the others, and his drawings began to run in *Der Sturm*, Germany's leading avant-garde periodical. The following year his works were included in two Blaue Reiter ("Blue Rider") exhibitions, but his own new and personal style was now clear.

The tense, exciting life of the big city gave his art a psychological and dynamic quality. There appeared a whole new series of subjects which reveal him as perhaps the outstanding and the most typical of the figurative expressionists. In his nudes out of doors nature is used as a mirror of the artist's soul, the figures emerging from their background in a state of nature, emotions heightened by conflicting rather than complementary color, by brutalized forms, and by distorted perspective (V, PL. 208). Similarly, the city scenes of Kirchner and his friends

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

(e.g., his *Street Scene*, 1913; New York, Mus. of Mod. Art) have a philosophical intention as they project anonymous mask-like faces moving aimlessly about the metropolis. Kirchner is more analytical in these scenes than in the representations of nudes seen out of doors, where he was more poetic and universal, but both types of work are part of his interpretive attitude toward art, the basic expressionist quality of searching to find some deeper value beyond the mere physical appearance, which he has destroyed by selfconscious distortions of form, color, and space. His infrequent portraits (for example, *Sick Woman*, 1912; Frankfurt, private coll.) are as probing and subjective as his other works.

Invalided out of the army after a nervous breakdown during World War I, he settled in 1917 in Switzerland near Davos, where he spent the rest of his life in a mountain retreat at Langmatt, the city philosopher becoming the poet of the mountains and peasants. His nervous, graphic Berlin style yielded to a more sculpturesque form and to a new color quality (no longer stressing dissonances, but rather emphasizing an enamellike brilliance that supports the new form interests) which strive toward a monumentality and serenity far removed from his earlier work. His figures convey the feeling of the rough-hewn work of some archaic period, his glorified peasant protagonists revealing another philosophical facet of his creativity.

Following the Nazi purge of modern art in 1937 and because of his failing health, Kirchner took his own life in June, 1938.

Bernard S. MYERS

KLEE, PAUL. Painter and graphic artist (b. München-Buchsee near Bern, Switzerland, Dec. 18, 1879; d. near Locarno, June 29, 1940). Klee was the son of Hans Klee, a German musician (1849–1940), and Ida Maria Frick of Basel (1855–1921). In 1880 the family moved to Bern, where the young Paul attended primary school and in 1898 was graduated from the Literarschule. From 1898 to 1901 he studied in Munich, first at the painting school of E. Knirr and later with Franz von Stuck at the Munich Academy. Kandinsky (q.v.) was attending the Academy at the same time, but the two artists did not meet until 1911. In Munich Klee took courses in anatomy and the history of art, learned etching, and experimented with sculpture. At the same time contact with the active musical life of Munich strengthened the interest in music which he had inherited from his family. For a long time Klee was undecided whether to take up painting or music, for both of which he was gifted; in fact, his theories of painting were to a large extent formed by analogies with musical theory. In 1901 Klee, together with the Swiss sculptor Hermann Haller, traveled to Italy, visiting Milan, Genoa, Rome, and Naples. On May 7, 1902, he returned to Bern, where for financial reasons he was forced to remain with his parents until 1906. At first he devoted himself more to drawing and graphic arts than to painting, perhaps in the hope that as an illustrator he could earn enough to keep alive. From 1903 to 1905 Klee etched his ten *Inventions*, which he showed at the Munich Sezession in 1906. These were his first original works. The *Inventions*, which were satirical in intent, grew out of a particularly bitter and pessimistic period in Klee's youth. In 1905 Klee began a series of drawings and water colors on glass. In 1906 he visited the Centenary Exhibition in Berlin and saw the Rembrandts at Kassel and the Grünewalds at Karlsruhe. A series of shows held in Munich allowed Klee to study the work of Van Gogh (1908) and of Cézanne (1909), whom he called the master par excellence. In addition he studied works of Blake, Goya, and Ensor in the print room of the Munich Pinakothek. In September, 1906, Klee married the pianist Lily Stumpf and settled in the Munich suburb of Schwabing, where they lived until 1920. Their only child, Felix, was born in 1907. Klee's sole source of income during these early Munich years — until the start of the war — was the music lessons given by Lily; he was not able to sell his paintings. During this time music continued to attract him. He attended the concerts of Felix Mottl and, beginning in 1911, those of Bruno Walter. Recollections of his musical life appear in some of his later water colors, such as *The Vocal Fabric of the Singer Rosa Silber* (IX, PL. 397) and *Fiordiligi* (1923). His favorite composer was Mozart, but he also expressed appreciation in his letters for Debussy's *Pelléas and Mélisande*, calling it the most beautiful opera since Wagner, and for Schönberg's *Pierrot Lunaire*. The first exhibition of Klee's collected works took place at the Bern Kunstmuseum in 1910; the exhibition was shown subsequently in Zurich and in 1911 at Basel. In 1911 Klee exhibited 30 drawings at the Galerie Thannhauser in Munich and in the same year began a catalogue of his own works extending back to 1899. This catalogue is one of the most important sources for our knowledge of Klee's early works. Between 1911 and 1912 Klee also did 26 illustrations in pen for Voltaire's *Candide*, which were published in 1920. In 1912 Klee took part in the second Blaue Reiter ("Blue Rider") exhibition in Munich and the Sonderbund exhibition in Cologne, and in 1913 he showed at the Erste Deutsche Herbstsalon in Berlin, sponsored by the periodical *Der Sturm* and directed by Herwarth Walden. In 1911 Klee's circle of friends began to enlarge. A. Kubin visited him, and his old school companion from Bern, L. Moilliet, introduced him to August Macke, through whom he came to know Kandinsky and Franz Marc (qq.v.). He also became friends with A. von Jawlensky, M. von Werefkin, G. Münter, and Jean (Hans) Arp (q.v.; see also EUROPEAN MODERN MOVEMENTS). In the spring of 1912 Klee visited Paris, where he saw and admired the cubists' paintings and met Delaunay. His admiration for the latter led him to translate Delaunay's essay on light for the January, 1913, issue of *Der Sturm*.

In April of 1914 Klee traveled to Tunisia with Moilliet and Macke. It was this trip that fully opened his eyes to color. He noted in his diary: "That is the significance of this blessed moment. Color and I are one. I am a painter." In the weeks immediately following his return to Munich, Klee painted his Kairouan water colors. The outbreak of the war on Aug. 1, 1914, however, prevented public recognition of the paintings, and they succeeded in arousing the interest of his friends only. Klee's journey to Tunisia and a later one (1928–29) to Egypt may also help explain the close resemblances in his work to art of the Near East, especially Islamic art, in the use of arabesques — the interweaving of figures, plants, and animals, and the interchangeability of figure and ground.

With the war Klee's circle of friends broke up. Macke was killed in 1914, Marc in 1916. On March 11, one week after Marc's death, Klee too was called up. He was not sent to the front, however, but was assigned to garrison duty and escorting convoys to the front, so that to some extent he was able to continue painting. In 1918 he wrote an essay on the elements of graphic arts, which appeared in 1920 as a part of his *Schöpferische Konfession* (Creative Credo). Also in 1918 *Der Sturm* published a volume of Klee drawings, and two important essays on the artist appeared, one by W. Hausenstein, the other by T. Däubler. These publications mark the beginning of Klee's fame. On Christmas of 1918 Klee was demobilized and thus was able to return exclusively to his artistic activities. In 1920 he exhibited 38 canvases, 212 water colors, and 79 drawings at Goltz's in Munich. That same year both L. Zahn and H. von Wedderkop published monographs on the artist, and in 1921 one by Hausenstein appeared. The years immediately after the war were extremely productive for Klee. He painted numerous oils, including the well-known *Villa R* (1919; PL. 391), and executed a number of water colors, illustrating various themes, such as *Greeks and Barbarians* (1920). The range of his activities was increasing. On Nov. 25, 1920, he was called by Walter Gropius (q.v.) to teach in Weimar at the Bauhaus, which Gropius had founded in 1919. In January, 1921, Klee began his career as a teacher. The strict collaboration that Gropius required of Bauhaus instructors brought Klee into close association with Kandinsky and Feininger, both of whom remained with the institute until its closing by the Nazis in 1933.

Klee remained with the Bauhaus in Weimar until 1924; in 1926 he moved to its new location in Dessau. In 1931 he

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

resigned his position at the Bauhaus and accepted a professorship at the Düsseldorf Academy of Fine Arts. He remained there until 1933, when, as a modern artist, he fell under the suspicion of the Nazis and was forced to resign. In December, 1933, he left Germany for good and moved to Bern, where he resided until his death.

Klee's Bauhaus and Düsseldorf periods were particularly fertile. He developed a close relationship between his teaching and his creative activities, for he felt a strong need to define that which he had formerly done intuitively. His conscientiousness as a teacher led him to prepare his lessons in advance and carefully set them down in writing. These were published, together with a group of essays, in 1956. His *Pedagogical Sketchbook* was published in 1925 in the Bauhausbücher series. As a result of the 1923 Bauhaus Exhibition, which was attended by prominent figures from all over the world, Klee had an opportunity to meet and talk with Stravinsky, Busoni, and Hindemith among others. Through his association with the Bauhaus he also came to know Adolf Busch, Edwin Fischer, Driesch, Ostwald, Ozenfant, Gleizes, Kurt Schwitters, and the poet Léon-Paul Fargue. In 1924 Klee, with Kandinsky, Feininger, and Jawlensky, helped found the group called "the Blue Four" (Der Blaue Vier). In 1925 he participated in the first surrealist exhibition in Paris and organized a one-man show at the Galerie Vavin-Raspail. The mid-twenties were also the beginning of frequent travels for Klee. In 1923 he vacationed on the island of Baltrum in the North Sea; in 1924 he was in Sicily; in 1925, in Italy and the island of Elba; in 1927, Corsica and the island of Porquerolles; in 1928, Brittany; from December, 1928, to January, 1929, in Egypt; in the summer of 1929, in southern France; in 1930, the Engadine Valley in Switzerland; in 1931, again in Sicily; in 1932, in northern Italy and Venice; and in 1933, the French Riviera.

By 1929 Klee had become an artist of international renown. His fiftieth birthday was marked by a one-man show at the Galerie Flechtheim in Berlin, and the following year the show was transferred to the Museum of Modern Art in New York. In 1934 Klee organized his first one-man show in England. It was held at the Mayor Gallery in London. In 1935 the Bern Kunsthalle held a large Klee retrospective. That same year Klee felt the first signs of the illness that was to cause his death. He nevertheless continued to work steadily except for 1936, when he was too ill to produce more than a few pieces. The last few years of his life, in fact, were especially productive. During this time in Bern he also took a few short trips, spending the summer of 1936 in Tarasp and Montana in Switzerland, the next two summers respectively at Ascona and Beatenburg, and the autumn of 1939 on the Murtensee. In 1939 he also visited the Prado Exhibition at Geneva. Picasso, Braque, and Kandinsky visited Klee in Bern in 1937. In the same year 17 of Klee's pictures were exhibited in Munich in the Nazi exhibition of "Degenerate Art," and his work was removed from German museums. In 1938 a large Bauhaus exhibit was held at the Museum of Modern Art in New York, in which some of Klee's paintings were shown. That same year saw the creation of seven large oils, which are among Klee's most important. The paintings of 1939 and 1940 may be said to be Klee's own requiem; they are filled with images of angels and the presentiment of death (PL. 394). In February, 1940, a large Klee exhibition was held at the Kunsthaus in Zurich. On May 10 Klee entered a hospital near Locarno. On June 29 he died. Large retrospectives of his work were held soon after his death: in Bern and New York in 1940, in Basel and Zurich in 1941. In 1947 the Klee Foundation (Paul-Klee-Stiftung) was established at the Bern Kunstmuseum.

Klee began his career as a draftsman and etcher. Of his almost 9,000 works, about 5,000 are drawings. Much of his *oeuvre* is now in the Klee Foundation, which comprises 2,571 items, of which 2,250 are drawings. Another important group of 1,324 works, including 689 drawings, is owned by the artist's son, Felix Klee, in Bern. The rest are scattered in various public and private collections, principally in the United States.

Klee's fame as an artist is due in large part to his ability to transcend abstract pictorial invention to achieve a "rebirth of creation," and partly also to the wide range of allusions to music, poetry, and Eastern philosophy that he was able to incorporate in his art. Klee's work always began "with the smallest things," that is, with a pictorial motif, which he developed into a theme as a composer develops a musical motif (PL. 391). His point of departure was not the finished forms of nature but the process of creation itself. In his *Schöpferische Konfession* Klee wrote that "art does not render the visible; rather, it makes visible." He wanted, he said, to make evident "the reality of visible things," since "the visible realm is no more than a 'special case' in relation to the cosmos" and other truths may predominate. It was necessary, he wrote, to strive for "the essence that lies behind the fortuitous." From abstract elements could be built up a universe of form which would correspond to the macrocosm. In 1923 Klee published, as a Bauhaus teacher, his *Ways of Studying Nature*. In it he outlined the multiple ways of analyzing an object according to its anatomical, physiological, and biological aspects and its terrestrial (static) and cosmic (dynamic) relationships. The purpose of such an analysis, according to Klee, was to aim at a total correspondence between the "I" (the painter) and the universe, and to create pictures which differ from optical reality without contradicting it.

In 1924, at a conference held at the Jena Kunstverein, Klee delivered a lecture in which he compared the relation of art to nature with that of the crown to the root of a tree: as the crown cannot mirror the roots that feed it, because "different functions operating in different elements lead to vivid divergencies," so art must transform and not merely imitate nature. He asserted that the artist must concern himself with the dimensions of mass (line), weight (tonality), and quality (color), not with resemblance. If a formal motif is developed into a pictorial structure, "it is easily joined by an association which acts as an enticement toward an objective meaning." These associations may lead to misunderstandings if the viewer tries to compare them with the given forms of nature, but for the artist they are merely a fortuitous encounter in the course of his creative activity. The artist must aim not at representation but at creating his own archetypes; he must seek "the primary ground of creation where the secret key to all is kept." For Klee, art, like nature, is a generative force; the artist works as nature does, except that in the end "the picture looks at him"; something identifiable and meaningful results, because, as Goethe had observed, "to an unknown law of the object there corresponds an unknown law of the subject."

As a painter who was also a musician, Klee sought to find in painting a theory of harmony that could be of use to both students and teachers. He composed with pictorial elements the way a musician works with notes, motifs, themes, and modulations; and although he believed in a clear separation of the arts, his work has definite points of contact with music. His *Fugue in Red* of 1921 is, to be sure, a pictorial fugue; nevertheless, like a musical fugue, its structure is based on the principle of imitation. Among Klee's works can be found pictures which have a clear polyphonic or homophonic character, pictures with continuous melodic line, with ascending and descending rhythms, with tonal and atonal relationships, and so on (V, PL. 137).

Klee was a poet as well, and the associational titles he gave to his pictures, such as *Lomolarm* ("L'homme aux larmes" or "man of tears") and *Stuhltier* ("chair-animal"), show a highly inventive use of language. His *A Light and Dry Poem* is a poem in pictorial signs and its title a poetic metaphor. In such titles may be read the measure of Klee's poetic sensitivity (PL. 393).

Klee's work evolved slowly until 1914, and he produced little in color up to that time. After 1914, however, the range of his pictorial devices and motifs expanded considerably. His Kairouan water colors were based upon Delaunay's principle of building up a subject by means of rhythmically active color contrasts, but they were entirely original schemes. From 1914 on Klee created in all about 30 different compositional schemes in which formal inventions were developed into a wide variety of pictorial conceptions. He created paintings and drawings arranged as rigidly as notes on a musical staff; screenlike pictures with intersecting vertical and horizontal lines; pictures with

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

fanciful perspectives; compositions formed by succeeding parallels or with small squares of different colors (PL. 393); some with volumetric shapes which seem like animated pieces of cut and folded paper; and finally others with dark and heavy bars which seem to have as their subject matter ultimate questions of life and the world (PL. 392). Klee's methods enabled him to create images of an originality such as had never before been achieved in painting, as for example *The Fateful Hour: 11:45* (1922); *Pastoral* (1927); *Before the Snow* (1929); *Drum Organ* (1930); *Heroic Fiddling* (1938), a homage to the violinist Adolf Busch; or *Forgetful Angel* (1939). From 1930 on Klee succeeded in realizing to an increasing extent the "multidimensional simultaneity" he was seeking in painting and which, for him, had spiritual implications.

To select a certain number of masterpieces from Klee's work is impossible, for almost everything he did is on the same high level. The catalogue of his work comprises 733 canvases, 3,197 paintings on paper (water colors and mixed media), 4,877 drawings, 54 etchings, 38 lithographs, 3 woodcuts, and 16 small sculptures. The literature on Klee has become so enormous that only a selected bibliography can be given here. The list of Klee's own writings is complete.

PRINCIPAL EXHIBITIONS TO 1940: 1906: Munich Sezession. – 1910: Kunsthaus, Zurich. – 1911: Galerie Thannhauser, Munich. – 1912: Blaue Reiter exhibition, Munich. – 1912: Sonderbund exhibition, Cologne. – 1913: Der Sturm, Berlin. – 1917: Galerie Dada, Zurich. – 1919: Zinglers Kabinett, Frankfurt am Main. – 1919: Galerie Gurlitt, Berlin. – 1919: Kestner-Gesellschaft, Hannover. – 1920: Galerie Flechtheim, Düsseldorf. – 1920: Galerie Goltz, Munich. – 1921: Kunstverein, Cologne. – 1921: Neue Sezession, Munich. – 1923: Kronprinzenpalais, Berlin. – 1923: Galerie Thannhauser, Munich. – 1924: Galerie Fides, Dresden. – 1924: Société Anonyme, New York. – 1925: Galerie Goltz, Munich. – 1925: Galerie Vavin-Raspail, Paris. – 1926: Galerie Fides, Dresden. – 1926: Kunsthaus, Zurich. – 1927: Galerie Flechtheim, Düsseldorf. – 1928: Galerie Le Centaure, Brussels. – 1929: Galerie Flechtheim, Berlin. – 1929: Galerie Bernheim, Paris. – 1930: Nationalgalerie, Berlin. – 1930: Museum of Modern Art, New York. – 1931: Kunstverein für die Rheinlande und Westfalen, Düsseldorf. – 1934: Mayor Gallery, London. – 1935: Kunsthalle, Bern. – 1938: Buchholz Gallery, Curt Valentin, New York. – 1938: Ballay et Carré, Paris. – 1938: Nierendorf Gallery, New York. – 1938: Museum of Modern Art Bauhaus exhibition, New York. – 1940: Nierendorf Gallery, New York. – 1940: Germanic Museum, Harvard University, Cambridge, Mass. – 1940: Kunsthaus, Zurich.

KNELLER, SIR GODFREY. English painter (b. Lübeck, 1646 or 1649; d. London, Oct. 19, 1723). Kneller studied under Ferdinand Bol, and possibly Rembrandt, in Amsterdam in the 1660s and went to Italy late in that decade or in the 1670s. During his stay in Rome, Naples, and Venice he came to know Carlo Maratti and Bacciccio (G. B. Gaulli), the leading Italian portrait painters of their period. In 1674 Kneller settled in England. Little is known of his activity between 1678 and 1682, during which time he may have made several trips abroad. Knighted on March 3, 1692, and created a baronet on May 24, 1715, he was raised by these honors to a position of social eminence unequaled by other English artists until the reign of Queen Victoria, and from this time was the dominant artistic figure of his age in England. In 1711 he became the first Governor of the Academy of Painting, a position that he held until 1716.

Kneller was one of the first English artists to regard the portrait, rather than as purely a work of art, as a document concerned with the likeness of a historical personality. His first known work, *The Philosopher* (1668; Lübeck), is similar to the work of other pupils of Bol. No paintings dating from his sojourn in Italy are known. *Admiral Tromp* (1675; Devon, Antony House), the first known painting of his post-Italian period, is still within the spirit of Bol. There was no marked change in his work until about the time he was introduced to the court; the style of his *Mr. Vernon* (1677; London, Nat. Portrait Gall.), for instance, recalls the paintings of Maratti. The portrait of the Duke of Monmouth (ca. 1677; Sussex, Goodwood House), traditionally attributed to Kneller, is considered his first outstanding achievement. It was possibly this portrait which led to his introduction to the King, as well as to his sudden rise in popularity. About 1683 Kneller attained his mature style, a manner which reflects that of Peter Lely (q.v.). His studio housed a multitude of assistants, who specialized in rendering parts of costumes or backgrounds, and frequently Kneller was responsible only for the face of the sitter; yet, though his extremely large output was often indifferently composed and executed because of this atelier system, he was himself capable of doing exceptional work. The best of his later work, created after 1700, reveals Kneller's interest in the perception and communication of character, qualities especially apparent in the "Kit Cat" series (1702–18; London, Nat. Portrait Gall.).

REPRESENTATIVE WORKS. *Sir Charles Cottrell* (1683; Oxfordshire, Rousham House, T. Cottrell-Dormer Coll.). – *Duchess of Portsmouth* (1684; Sussex, Goodwood House). – *Philip, Earl of Leicester* (1685; Kent, Penshurst Place, Viscount De L'Isle Coll.). – *Chinese Convert* (1687; London, Kensington Palace). – *Mrs. Dunch* (1689; Sussex, Parham, C. Pearson Coll.). – *Anthony Leigh as "The Spanish Friar"* (1689; London, Nat. Portrait Gall.). – *Duchess of Marlborough and Lady Fitzhardinge* (1691; Oxfordshire, Blenheim Palace, Duke of Marlborough Coll.). – *Dr. Burnet* (1691; Surrey, Charterhouse). – *Jacob Matthew Prior* (1700; Cambridge, Trinity Coll.; VI, PL. 438). – *Jacob Tonson* (1717; London, Nat. Portrait Gall.).

KOKOSCHKA, Oskar. Bohemian-born Austrian painter, graphic artist, illustrator, and author (b. Pöchlarn, Mar. 1, 1886), outstanding and highly influential expressionist who carried the movement on to an international plane. While still a child, Kokoschka was drawn to African and Oceanic art (cf. Kirchner, Pechstein, Derain, Picasso). In 1905 he was given a scholarship to the Vienna School of Arts and Crafts, where he disliked the conventional approach but derived the beginnings of a decorative attitude which emerged in his early Art Nouveau linearism; he was also influenced by the Austrian Gustav Klimt and by Oriental art. His book of illustrated poetry, *The Dreaming Boys* (1908), reveals the mystical eroticism typical of his work as a whole.

Kokoschka shows a partly Fauve, partly expressionist reaction to the prewar decadence of Vienna in such paintings of the 1907–12 period as *Auguste Forel* (Mannheim, Städt. Kunsthalle) and *Hans and Erica Tietze* (New York, Mus. of Mod. Art), where a fragile, nervous line embedded in a yellow-gold background animates the always significant hands. All the portrait studies of this period show a kind of clinical analysis, a probing for the inner person beneath the outward physical appearance.

Through both his art and his writing — dramas which project with outspoken sex and violence the conflict between man and woman — Kokoschka became a *cause célèbre* (1908–09). The term "degenerate artist," later made famous by the Nazis in Germany, was already being applied to Kokoschka in 1909 by the Austria that was to produce Hitler himself. In 1910 Kokoschka went on to Berlin, where he found himself among many like-minded artists, especially the Brücke members who had come from Dresden (see KIRCHNER), progressive dealers like Paul Cassirer, and avant-garde editors like Herwarth Walden, for whose *Der Sturm* Kokoschka immediately became an illustrator. It seems fairly clear that at this point Kokoschka exercised a strong influence on the Brücke painters, who were just turning from a Fauve-oriented type of painting.

In 1911 the "public terror" of Vienna returned there for an exhibition, and it was then that he produced his drama *The Burning Thornbush* and his two famous lithographic series, *Bach Cantata* and *The Fettered Columbus*. He also began his tempestuous relationship with Alma Mahler, who was immortalized in his painting *Bride of the Winds* (or *The Tempest*, 1914; Basel, Kunstmus.), which, like other works of this period, shows a shift from the earlier involuted Freudian approach and presents a freer, looser handling of paint and a bolder, more assertive, romantic style appealing directly to the spectator. In this depiction of two lovers lying side by side in their cockleshell whirling through space, Kokoschka mingles the real and the unreal, the material and the unearthly.

Severely wounded in the head during World War I in the Russian campaign of 1916, Kokoschka was invalided to Dresden. At this time he was a miserable, even irrational being who was, however, recognized by a professorship in the Dresden Academy. From the end of the war through the revolutionary and inflationary period, Kokoschka turned to a more vividly coloristic but compact type of paint application, influenced by such French postimpressionists as Seurat and Cézanne. In 1924 he left Dresden and began his long travel period (1924–31), during which he portrayed the great cities of the world in an inherently emotional but very broad and spatial manner, evoking in each case the spirit of a city (London, Marseilles, Algiers, Jerusalem, Paris, etc.).

Kokoschka's landscape paintings parallel in a general way his other works but with less passion and, by and large, with more decorative quality in an impressionist sense (e.g., *Courmayeur et les Dents des Géants*, 1927; Washington. D.C., Phillips Coll.). This lyrical reaction to nature has remained fairly constant, persisting into the 1940s and 1950s. Kokoschka returned to Vienna in 1931 and during the next three years became increasingly active in politics against the rising Nazi tide, moving on to Prague in 1934 for a four-year stay in his native land. His *Self-Portrait of a Degenerate Artist* (1937; coll. of the painter) underlines both his preoccupations of the moment and the state of art in central Europe at that point.

He fled to England in 1938 and spent the next ten years at Polperro in Cornwall (V, PL. 213). In 1947 he went to Switzerland, where his pent-up energies were released in a new series of lambent landscapes in which the old subjects of a previous generation were treated with a new sensitive emotionalism showing as great a grandeur and sweep as ever (e.g., *Montana*, 1947; IX, PL. 25). In addition, the humanist and politically oriented Kokoschka still persists in such paintings as the *Thermopylae* (1954; Villeneuve, private coll.), a projection of the conflict between East and West in the ancient story of the war between the Greeks and the Persians (see also I, PL. 410; V, PLS. 141, 206; XI, PL. 228).

Bernard S. MYERS

KOLLWITZ, Käthe. German graphic artist (b. Königsberg, 1867; d. Moritzburg, 1945). Although her favored technique was etching, sometimes in combination with the aquatint process, Käthe Kollwitz also produced many lithographs and in her later life did woodcuts, all of which were the outcome of many preliminary drawings. Without failing to become deeply involved psychologically in whatever work at hand, she nonetheless demanded of herself the most rigorous technical standards. Throughout her career a preoccupation with realistic portrayal of the poorer classes made her work a strong social and political document of her time.

After settling permanently in Berlin in 1891, Kollwitz was inspired by the initial performance of Gerhart Hauptmann's *The Weavers* (1893) and made her first great print cycle, *Der Weberaufstand* (1894–98). In 1902 she began another great series, *Peasant War*, which was not finished until 1908. Her son Peter was killed in World War I, and her next major work, *War* (1923), reflects the artist's personal tragedy and reaction to war. Thereafter, another cycle, *Proletariat* (1925), demonstrated her continuing concern with social problems. Single plates and woodcuts that are widely known include *La Carmagnole* (1901), an etching inspired by *A Tale of Two Cities*; *Mother and Child* and *Death and the Woman* (1910); and a woodcut with strong political connotations that commemorated Karl Liebknecht, as well as various propaganda posters.

A noteworthy characteristic of Käthe Kollwitz was her life-long interest in the self-portrait, manifesting a deep psychological insight reminiscent of Rembrandt, Callot, and Goya. She was also strongly interested in sculpture and admired Barlach in particular. His remarkable equilibrium between naturalism and stylization finds its counterpart in the monumental realism of her graphic creations, whose suggestion of volume frequently approaches the sculptural. Her one important sculptural project was a monument for her son, erected in Diksmuide cemetery (Flanders; 1924–32). Important late works include her last cycle of lithographs, *Death* (1935), and the touching final self-portrait, a lithograph of 1938 that depicts her as a worn old woman.

In 1919 Käthe Kollwitz became the first woman member of the Prussian Academy of Arts (Berlin), and in 1928 she became director of the academy's master classes for graphic arts, a post from which the Nazis dismissed her in 1933. From 1936, exhibitions of her work were prohibited in Germany, but despite such official opposition she remained there throughout World War II; she died in Moritzburg Castle, near Dresden. Her internationally acclaimed work first appeared in New York in a print show of 1912. Major Kollwitz exhibitions include: New York, 1925; Moscow, 1927, 1932; Basel, 1929; Berlin, 1945 (memorial exhibit); Bern, 1946; Rotterdam, 1947; Moscow, 1954; New York, 1962.

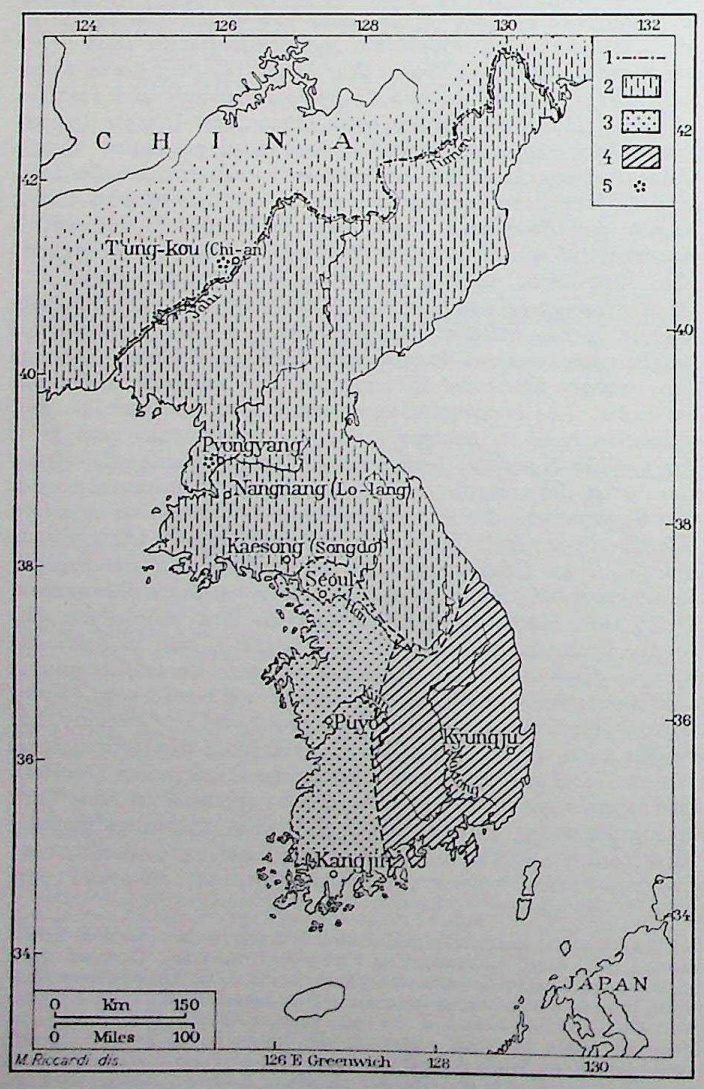
KOREA (Chosen). Korea possesses a noteworthy artistic heritage, although wars and invasions have destroyed many works of art and monuments and even caused the disappearance of entire cities. Not all the surviving monuments of Korean art are to be found in Korean territory, since for a long time the kingdom of Koguryo had its capital in what is now Manchuria. The present survey of surviving artistic material will also consider remains existing outside the Korean peninsula and indicate the area of Korean artistic influence irrespective of the fluctuations of political boundaries.

SUMMARY. Historical background (col. 1019). Art centers and groups of monuments (col. 1021).

HISTORICAL BACKGROUND. Korea (which is divided into the Korean People's Republic, north of the 38th parallel, and the Republic of Korea, south of the same parallel) is a peninsula projecting from the Asian continent but separated from it by mountains, forests, and two great rivers, the Yalu and the Tumen. A range of mountains runs down the east coast of Korea and the general slope of the land is toward the southwest, where there are large rivers, broad plains, and a much-indented coastline. Communications are thus easier by sea than by land, particularly with the provinces of China that face Korea across the Yellow Sea. Korea has long maintained contact with Japan via the islands of the Tsushima Strait and transmitted to Japan the advanced culture that it received from China, thus acting as a bridge between the two countries. But this intermediate position caused Korea to suffer devastating wars and repeated invasion — from China during each of the main historical periods and from Japan at the end of the 16th century.



Korea: principal centers of artistic interest. *Key*: (1) National boundaries; (2) area of expansion of the kingdom of Koguryo; (3) area of expansion of the kingdom of Paekche; (4) area of expansion of the kingdom of Silla; (5) necropolises.

Korea is essentially a mountainous country, and its population is contained for the most part in small, relatively isolated villages distributed in countless valleys. There are few large towns, and since the end of the 14th century the city of Seoul has been the capital and almost the only important center. Because of the destructive invasions already mentioned, little would have remained of Korea's ancient arts, but many great works were made of stone (a material that abounds in Korea), while other, more perishable articles were buried in tombs, the inner walls of which were sometimes decorated with paintings. The practice of interring funerary articles with the dead, however, was discontinued after the suppression of Buddhism and the rise of Confucianism early in the 15th century.

It follows that — apart from a number of stone monuments, especially memorial pagodas, lanterns, and sculptures, which are found at Buddhist monasteries and other sites throughout the country — virtually no important relics from the earlier historical periods have survived aboveground. Prehistoric artifacts of stone, bronze, and pottery have been found in many parts of the country, and a number of dolmens have been located, but the earliest cultural period of which details are known began with the establishment of a Chinese colony, Lo-lang (Kor., Nangnang), in northern Korea in 108 B.C. This settlement lasted for about four hundred years, and important discoveries of Han lacquerware, bronze and iron vessels, weapons, and so on (see CHINESE ART) have been made at the Lo-lang graveyard in the vicinity of Pyongyang. These remains, however, are entirely Chinese and identical with similar finds in China itself; their significance for Korea lies mainly in their influence on the native arts. This can be traced in relics of the period of the Three Kingdoms, which followed the collapse of Lo-lang (see KOREAN ART). The northern kingdom of Koguryo existed side by side with Lo-lang, which it finally absorbed, and for many years its capital was T'ung-kou, Manchuria, beside the Yalu River. At T'ung-kou are the first important Korean monuments — several hundred tumuli, some of imposing size and many built of stone. The capital of Koguryo was later transferred to Pyongyang, and some tombs in this region as well as at T'ung-kou were found to contain stone chambers decorated with magnificent mural paintings, constituting the earliest great art of authentic Korean origin.

Virtually nothing has remained on Korean soil of the southwestern kingdom of Paekche, whose capital at Puyo was destroyed by a Chinese army in the year 660. It was Paekche that transmitted Buddhist civilization and art to Japan (see BUDDHISM). Paekche left its imprint on the 7th-century monastery of Hōryūji (near Nara, Japan), whose treasures undoubtedly include many works by Korean artists (see JAPAN). By far the most important ancient center in Korea, however, is Kyungju (near the southeast coast), where the third kingdom, Silla, established its capital. In 668 the greater part of the peninsula was unified under the rule of Silla, and in the Great Silla period which followed, Korean art attained its zenith, not merely as a result of importations from China but by its own individual creations. The scenic valley where Kyungju is situated forms an attractive setting for the vestiges of this ancient civilization, which escaped destruction by the Japanese in the invasion of 1592–98; but these remains are few and fragmentary in proportion to the fame of the Korean capital in the 8th and 9th centuries, with its wealth of palaces, temples, and works of art. There remain only some royal tombs (guarded by stone figures and encircled with groves), scattered stone monuments, foundations of buildings, rock-hewn Buddhist sculptures, and many large tumuli, from which gold crowns (VI, PL. 283) and ornaments, weapons, horse trappings, and a vast amount of pottery have been excavated.

About 8 miles from Kyungju lie the ruins of Pulguk-sa, the oldest Korean temple of which there are recognizable traces (PL. 397); near it, a half-hour's walk in the hills, stands the unique cave temple of Sukkulam (Sŏkkuram; II, PL. 394), whose Buddhist stone carvings are the sole worthy monument to this supreme period of Korean art. Some other 8th-century statues found in the same region have been placed in the small museum at Kyungju.

After the founding of the Koryo dynasty in 918, the capital was moved to Songdo (Kaesong), but nothing remains of the original city. The only surviving Koryo buildings are a few structures at Buddhist monasteries, notably at Pusok-sa (PL. 397), in southeast Korea. In this period, however, Korean porcelain, especially celadon, attained great fame and rivaled the products of Sung China. Many fine specimens of Koryo celadon have been recovered from the tombs of kings and noblemen in the vicinity of Songdo, and the two principal potteries have been located: one south of Kangjin, near the southwest tip of the peninsula, and the other some 80 miles to the north, near Ch'ulp'o-ri on the west coast. Many minor works of bronze, some inlaid with silver, and lacquerware with mother-of-pearl inlay have survived from the Koryo period; nearly all come from tombs.

1021

After the establishment of the Yi dynasty in 1392, the capital was moved to Seoul, where it has since remained. The city walls and imposing gates that have survived in Seoul and other towns, together with palaces and government buildings built in the traditional style, are relics of this period, which ended in 1910 with the Japanese annexation of Korea. So widespread, however, was the destruction wrought by the Japanese invasion of 1592–98 — as well as by natural calamities since that time — that the majority of the buildings of the Yi period have required partial or complete restoration, with the result that very few of the remaining structures date from the early part of the period; some, such as the main palace buildings in Seoul, were constructed as recently as the 19th century. Yi period architecture is perhaps better represented in the Buddhist monasteries scattered throughout the country, though here also fires and storms have necessitated a great deal of reconstruction. The monastic center in the Diamond Mountains is believed to have suffered grave damage during the Korean War (1950–53).

Many paintings on silk and paper and a large amount of pottery, especially blue-and-white, have survived from the Yi period. The most important collections, as in the case of all other Korean art works, are those of the National Museum and the Prince Yi Museum in Seoul; but there are also many fine examples of pottery and handicrafts at the Folk Art Museum in Tokyo.

ART CENTERS AND GROUPS OF MONUMENTS. T'ung-kou. Several hundred tumuli on the Yalu River, made of granite blocks in pyramid form or earthen mounds, at the site of the early capital of the kingdom of Koguryo, on the Yalu, dating from the 1st to the 4th century.

Pyongyang. Necropolis of the Chinese colony of Lo-lang, comprising hundreds of brick or wooden graves, dating from 108 B.C. to A.D. 313; individual tombs or groups of tombs, dating from the later years of the kingdom of Koguryo, that is, from the 5th to the 7th century. Some of the tomb chambers contain exceptionally fine mural paintings.

Kyungju. Sculptures, royal tombs, sites and foundations of buildings, stone monuments, ruins of Pulguk-sa, and the Sukkulam cave temple, all dating from the 5th to the early 10th century, when the kingdom of Silla reached its zenith.

Seoul. Walls, gates, and palace buildings dating from the Yi period (from the 15th century on), but mostly reconstructed during the past three centuries.

Diamond Mountains. Buddhist sanctuary: five monasteries founded in the first few centuries of our era, but reconstructed many times since then. Most of the present buildings date from the last three centuries.

KOREAN ART. Korea, throughout its history, has been profoundly affected by Chinese culture, but the importance of this external influence should not be overestimated, for native characteristics invariably developed after an initial stage of borrowing and assimilation, with the result that Korea has made distinctive contributions in the arts and crafts. In addition the transmission of Chinese culture to Japan by way of Korea had a deep and lasting influence on Japanese art.

SUMMARY. Lo-lang (col. 1022). Period of the Three Kingdoms (col. 1022): *Koguryo; Paekche; Silla*. Great Silla period (col. 1025). Koryo period (col. 1026). Yi period (col. 1027).

LO-LANG. Probably there is some truth in the legend that a kingdom was set up in Korea in 1122 B.C. by a Chinese refugee, Chi-tzŭ (Kor., Ki Ja) and his five thousand followers, but no trace has been found of this early culture. Neolithic remains discovered in Korea are believed to be of later date and do not as a rule show marked Chinese influence. However, there is archaeological proof to support the historical records that the emperor Wu-ti of the Han dynasty invaded northern Korea in 108 B.C. and established a military colony under Chinese governors. The colony was divided into four provinces, the chief of which was called Lo-lang (Kor., Nangnang), and it is by this name that it is now known.

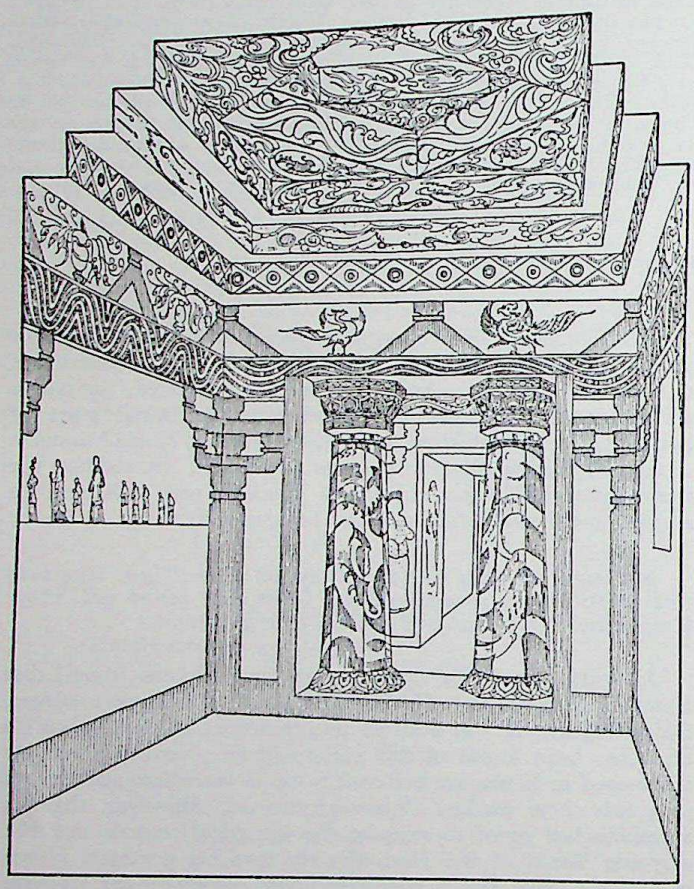
Numerous Chinese merchants and artisans migrated to this new outpost of the Han, and during the four centuries of its existence its influence extended far into southern Korea and even reached Japan. Considerable wealth and luxury evidently prevailed in the settlement, and excavations carried out by the Japanese authorities from 1910 to 1945, principally at the extensive graveyard not far from the Taedong River, have brought to light artistic treasures, chiefly of decorated lacquerware, but including also bronze and iron implements, horse trappings, jewelry, pottery, and fragments of silk and leather. Some of these discoveries, such as the celebrated "Painted Basket" (PL. 413), with its delicate figure paintings on lacquered surfaces, are finer than any similar relics found in China itself. The abundance and high quality of the relics are such as to make Lo-lang perhaps the most notable repository of Han art yet discovered.

PERIOD OF THE THREE KINGDOMS. *Koguryo*. The disappearance of Lo-lang was followed by the period of the Three Kingdoms (Koguryo in the north, Paekche in the southwest, and Silla in the southeast). Koguryo had come into existence during the 1st century B.C. and comprised a large part of what is now Manchuria as well as northern Korea. Its capital was at

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

first situated north of the Yalu River; the original location has not been determined, but it was later moved to T'ung-kou, near Chi-an, on the Yalu itself. This site is marked by several hundred tumuli, about half of which are made of granite blocks built up in pyramid form, while the others are rounded earthen mounds. Some of the tombs are of imposing size; the "General's Tomb," investigated by E. Chavannes in 1907, is one of the best preserved, although not the largest, measuring about 30 yd. square by 13 high. Funerary articles and other signs of identity had long since been removed, and it is not certain whether this is the tomb of King Kwanggaet'o (r. 391–412) — whose monument, an inscribed stele, stands about a mile away — or that of another, earlier king. In A.D. 427 King Changsu transferred the capital to Pyongyang, where it remained until the final overthrow of the kingdom by the combined forces of Silla and T'ang China in 668.



"The Tomb of the Two Columns," near Pyongyang, Koguryo period, 6th cent.

Although the more important tombs so far investigated had been looted by tomb robbers, some magnificent mural paintings have been found in the tomb chambers, which are usually single but sometimes double or triple and connected by short passages. This applies not only to the tombs beside the Yalu but also to several others near Pyongyang, which date from the later years of the kingdom and are mostly of earthen construction, although with stone chambers inside. The paintings sometimes represent the deities of the four cardinal points: Red Phoenix, Green Dragon, dragonlike White Tiger, and Tortoise entwined by a Snake (PL. 395). They are in the style that was doubtless current in China during the Six Dynasties period — indeed, there are records of early contacts with Chinese states and of artists being sent to Korea. However, nothing similar has been found in China itself, and the treatment of the imported symbols may be regarded as authentically Korean. Perhaps the finest examples are to be seen in the principal tomb (possibly that of King P'yong-won; r. 559–90) at U-hyonni, where three great tumuli of granite construction rise above the broad plain some 20 miles west of Pyongyang.

While the murals at U-hyonni are essentially stylized designs based on Chinese originals, many other paintings found in tombs at T'ung-kou and near Pyongyang show more individuality and vividly portray the costumes and way of life of the Koguryo people. A rather formal painting shows a king and queen seated in their palace with attendants grouped around them; there are sketches of serving maids bearing trays of food, and long-sleeved dancing girls giving a display. Some spirited hunting scenes show mounted huntsmen pursuing tigers and deer and shooting arrows. In addition, there are numerous decorative motifs along the friezes and cornices within the tomb chambers. Most of these are lotuses and other floral or geometric figures, but others show flying phoenixes and Buddhist themes. The paintings are in the style of the Han or Six Dynasties period and recall such Chinese examples as the painted Han tiles in Boston (III, PL. 234) and mural paintings in several Han tombs excavated near Port Arthur; the Koguryo murals, however, display a freshness, vitality, and naïveté which may justly be regarded as characteristic of Korean art.

Apart from the tomb paintings, little has remained of Koguryo art. Some small bronze images, together with their molds, and fragments of pottery bearing Buddhist figures, show the influence of the Northern Wei. A large number of tiles, decorated in relief with floral and animal motifs, have also been found near tombs and at castle and citadel sites; these tiles differ from those of other parts of Korea in the freedom and vigor of the style.

Paekche. Little enough is known of the art of Koguryo; still less would have survived of that of Paekche if this had not been the state which transmitted Buddhist culture from the continent to Japan. Very few remains have been unearthed at Puyo, the capital of Paekche which was destroyed by an army from T'ang China in 660; the sole surviving monument of any note is a stone pagoda erected by the Chinese general to commemorate his victory. Excavated relics are confined mainly to bronze images and vessels, often of superior workmanship, and ornamented tiles, of which some unique examples bear landscape designs of tree-clad mountains and valleys in relief; but some of the most celebrated Buddhist sculptures of the 7th century, preserved in the Hōryūji (Nara, Japan), are without doubt of Korean make and afford a glimpse of the mystical beauty which pervaded the religious art of Paekche. It is clear that the style itself did not originate in Korea but was derived from the Northern Wei; there can be no question, however, that its expression was distinctively Korean and that it provided the strong initial impulse in Japanese art of the Asuka period (see JAPANESE ART). Perhaps the most impressive of these early Korean sculptures, many of which are of wood, is the "Kudara Kwannon," traditionally ascribed to Paekche (Jap., Kudara), and unequalled for its archaic grace (PL. 396), but the "Yumedono Kwannon" (PL. 262), called by its discoverer E. Fenollosa, "the greatest monument of Korean art that has come down to us," is less aloof and of a more gracious expression.

There are two other masterpieces of 7th-century sculpture, also of carved wood, in Japan, which may be singled out as exemplifying the Korean style. The Maitreya in the Kōryūji (Kyoto) closely resembles a gilded-bronze statue (Seoul, Prince Yi Museum) which was found near Kyungju in Korea; the similar but far more impressive Maitreya known as the "Chūgūji Miroku" (PL. 266) may have been carved in Japan, but if so was undoubtedly the work of Korean craftsmen or their Japanese pupils. Historical records show that hundreds of skilled artists came from Paekche at this time and settled in the region of Hōryūji and Nara, and the classical beauty of Hōryūji Monastery itself is a monument to their genius.

Hōryūji Monastery (PL. 282) was originally built by architects from Paekche in 607, but there is evidence that a disastrous fire in 670 destroyed all but the Golden Hall (Kondō), around which the monastery was immediately reconstructed in the same style. This traditional "Kudara plan," as it is now called by Japanese historians, was followed after subsequent, less devastating fires. Here, therefore, may be seen the simplicity and restraint that marked the early Buddhist architecture of

UP State Museum, Lucknow

1025

Korea, for no similar structure has survived in Korea itself. Among the artistic treasures preserved at the Hōryūji is the famous reliquary known as the "Tamamushi Shrine," which is decorated with archaic Buddhist paintings (PL. 418) and exhibits the same architectonic elegance. Although the origin of this shrine is unknown, the fact that it is ornamented with the iridescent wings of beetles suggests that it may also be of Korean make, for the same technique has been found only in objects excavated in southern Korea.

Silla. The third state during the period of the Three Kingdoms was Silla, known to contemporary Arab traders and described as "a mountainous land rich in gold," whose capital, Kyungju, was set in a valley of great scenic charm not far from the southeast coast. The most conspicuous feature of this region at the present time is the large number of tumuli which rise on all sides from the paddy fields and among the scattered villages. Many of these tombs have been opened in this century and, despite the depredations of robbers, have yielded a vast store of relics from the early Silla period, before the kingdom extended its territory over the whole of Korea. The most striking finds are the gold crowns (VI, PL. 283), consisting of broad bands surmounted by conventionalized trees with numerous gold spangles and jade *magatama* (crescent jades) attached. The tombs also contained ornaments; weapons, including swords, axes, daggers and halberds, sometimes with elaborately ornamented pommels; horse trappings; bronze mirrors; and iron or bronze cooking vessels. Some Chinese influence is evident in these articles, but the gold crowns and the ear pendants are distinctively Korean. A great quantity of unglazed earthenware has also been collected from the tombs, the characteristic type being brittle pottery of bluish-gray color with crudely incised or stamped ornament — mainly cups, jars, and vases on tall stands with openings in the sides, no doubt intended to be placed directly on the cooking fires. While most of the shapes are utilitarian, some crude but vigorous clay figurines have been found, and a vessel in the form of a mounted warrior must be classed with the major achievements of representational art (PL. 398).

Some of these relics, especially the pottery and *magatama*, show an affinity to similar articles excavated in Japan, which may be taken as evidence of close cultural relations between the two countries.

A gilded-bronze Maitreya (PL. 396), considered to date from this period, demonstrates the high artistic level attained and indicates that the artisans and bronze casters of Silla were no less accomplished than those of Paekche.

GREAT SILLA PERIOD. The unification of Korea under the rule of Silla took place in 668, after the successive overthrow of Paekche and Koguryo. This marks the beginning of that supreme era of Korean art and culture called the Great Silla period which lasted for 250 years. Unfortunately, the Japanese invasion of 1592–98 wrought such widespread destruction as far north as Pyongyang that few important relics from this time have survived. The most impressive remains are the ruins of Pulguk-sa, a temple near Kyungju, and the unique cave temple of Sukkulam in the hills nearby.

Pulguk-sa was founded in the early 6th century and rebuilt in grand style in 751; the cave temple of Sukkulam was probably constructed at that time. Both, according to tradition, were built under the direction of the prime minister, Kim Taisung. Of Pulguk-sa only an arched stone stairway and balustrade remain, together with stone pagodas, lanterns, and two bronze images, but even these few traces give some idea of the classic beauty of the original structure (PL. 397). The cave temple of Sukkulam, however, was discovered almost complete, although in a ruined state, and has been restored to something like its original condition. It is an artificial cave, consisting of a small antechamber with an unroofed passage leading to the main rotunda, which is faced with granite and has a domed roof; the entire structure is covered with earth and appears to form part of the hillside. In the center of the rotunda is a statue of the seated Buddha on a pedestal, remarkable for its massive proportions and great dignity. The granite-lined walls of both entrances and rotunda are decorated with 27 reliefs of bodhisattvas, lohans (Skr., *arhat*), heavenly kings, and guardians, above which eight smaller seated figures occupy arched niches. The extraordinary grace and beauty of the bodhisattvas, the nobility and vigor of the kings and guardians, and the stark realism of the lohans, some of whom have Caucasian or Semitic features, are unequalled in the surviving art of T'ang China, by which they were plainly inspired. There is a legend that Chinese artists were employed on the work, but evidence of the high quality of stonecarving in Silla indicates that more likely the artists were predominantly Korean (II, PL. 394).

There are also many stone monuments at royal tombs, such as the massive and lifelike tortoise marking the tomb of King Muryol (dating from 662, preceding the Great Silla period by a few years), and effigies of men and beasts in a double line guarding the approaches. The pagoda of Hoaom-sa Monastery, with its supporting lions, is one of the finest examples among a large number of stone memorials and lanterns. Many fine tiles, plaques, and paving stones, bearing elaborate relief ornament of Buddhist subjects or floral rosettes and arabesques, have been found at the sites of important buildings.

The bronze casters of Silla attained great proficiency in making large temple bells, which became famous throughout the East. Probably the finest extant example is the great bell at Kyungju, dating from 770, with delicate relief ornament of Buddhist celestial figures and floral designs that shows the Korean feeling for graceful, flowing linework (PL. 396). Another famous bronze bell, made in 725, was lost in the destruction of Wolchong-sa Monastery during the Korean War. A number of small Buddhist images in gilded bronze have been recovered; the refined taste and classicism of the period are evident in their serene countenances and elegant forms. Pottery continued in the tradition of the earlier Silla wares, but the stamped or incised decoration became more elaborate (PL. 398), and attempts were made to produce a colored glaze.

KORYO PERIOD. A revolt against the degenerate royal house brought the Great Silla period to an end in 918, a new dynasty was established, and the capital was moved to Songdo (or Kaesong). The kingdom was renamed "Koryo" ("High Hills and Sparkling Waters") and a brilliant new epoch began, marked by the rise of Buddhism to unprecedented power and the building of numerous temples or monasteries. Because of natural calamities and invasions, only three original structures are known to have survived from the Koryo period, apart from stone monuments and pagodas. The two most important structures are located at Pusok-sa Monastery, in a remote part of southeastern Korea.

The "Hall of Eternal Life" at Pusok-sa is a large wooden building of great simplicity and charm, constructed in the late 13th century (PL. 397); it contains perhaps the finest remaining Koryo sculpture, a wooden image of Amitābha. The smaller "Founder's Hall," built in the last years of the dynasty, is less archaic and transitional in style, giving a foretaste of the architecture of the Yi period; this building contains the earliest wall paintings (bodhisattvas and heavenly kings) which have been found in Korea outside tombs.

Other than the Amitābha at Pusok-sa, relatively little sculpture has survived from the Koryo period. A colossal stone Maitreya at Nonsan in southwestern Korea, dating from the late 10th century, possesses littles artistic merit. Some carved wooden or lacquered figures of Kwannon exhibit the plump worldliness and elaborate dress ornaments which characterize 12th- and 13th-century Buddhist sculpture in China: there could hardly be a more marked decline from the dignified classicism of Great Silla.

A new standard, however, was set by the bronze mirrors and ornaments, while the ceramic products of the Koryo period have made Korean art famous throughout the world. Koryo celadon in particular has come to be regarded as among the most beautiful pottery ever made (PL. 399).

Recent research has made it clear that the Koryo potters learned the art of making high-fired porcelaneous wares from

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

the Yüeh factories of Chekiang province in southern China, probably during the latter part of the 11th century. At first the Koreans were content to imitate the more famous Chinese wares, but by the early 12th century they had developed their own native style and were producing distinctively Korean porcelains, which are unsurpassed for beauty of form and exhibit an effortless grace and serenity.

In 1123 a Chinese scholar, Hsü Ching, accompanied an envoy from the Sung court on a visit to Korea; his vivid account of the country has fortunately survived. He noted that the Koryo potters had made great advances in recent years and was greatly impressed by the novelty of some of their designs and the beauty of the "king-fisher-colored" or bluish-green celadon glaze. Specimens of the identical types he described have been excavated from royal tombs near Songdo. Soon afterwards the Koreans developed the unique device of inlaying different clays to produce striking black-and-white decoration. This innovation may have had its antecedents in the stamped or incised pottery of the Silla period and the inlaid metalwares of T'ang China, but it became a distinctively Korean style and was exploited to great effect. Nowhere is the Korean spirit expressed with more charm and naïveté than on celadon pots and vases of the Koryo period, with their quiet country scenes of birds, trees, and flowers traced in long flowing lines and graceful curves. The same method was used for decorating metalwares and lacquered chests and boxes; an outstanding example, one of the chief treasures of Koryo art, is a bronze sprinkler vase inlaid with silver.

In 1231 Korea was invaded by the Mongols, and the arts suffered a severe blow, from which they took many years to recover. Mongol influence is apparent in a tendency toward excessive ornament during the latter part of the Koryo period, but some bronze bells and incense vessels show that creative ability was maintained to the end of the dynasty.

YI PERIOD. With the founding of the Yi dynasty in 1392 by the strong but moderate Yi Taejo, the capital was moved to Seoul and the entire culture underwent a transformation. Buddhism fell into disfavor and was replaced by a rigid Confucian formalism, which imparted masculine strength to the arts but brought about their steady decline. Elaborate palaces were built in the new capital, but none of the original structures remain: the Kyungbok Palace was rebuilt in grandiose style as recently as 1867, and its ornate features and coffered ceilings should not be taken as representing the best in Yi period architecture, although the building as a whole is not without dignity. However, it was in painting, pottery, and handicrafts that the Korean artistic genius found a new and vital expression, though its development was arrested and impaired by the Japanese invasion of 1592–98.

Korean paintings now in existence with few exceptions date from the Yi period and follow the tradition of Chinese Ming paintings, from which they are not easily distinguished (II, PL. 394). A native Korean style is evident in some attractive studies of domestic animals, especially cats, kittens, and puppies, which are painted with great verve and fidelity, and also in paintings of birds, flowers, and insects. Some vivid genre sketches date from the late 18th century and after, while the portraits commissioned by noblemen and scholars in the same period show remarkable power of characterization. One of the most prolific artists of this time was Kim Hong-do (VI, PL. 81), also known as Tanwon, whose versatile genius found expression in traditional landscapes and figures as well as in the contemporary portraits, genre scenes, and fan paintings.

The pottery of the Yi period was at first rough and crude, showing in its robust forms and vigorous iron-brown painting the unself-conscious artistry of the peasant potter. Later in the period an official factory was set up near Seoul and followed the Chinese trend by producing white and blue-and-white porcelain but the Korean blue decoration was sparingly applied. By the late 18th century, however, the decoration had become over-profuse, losing its former significance.

Many Korean potters were taken captive during the Japanese invasion of 1592–98 and were resettled on the island of Kyushu, where they laid the foundations of the Japanese porcelain industry. Some Korean porcelains brought back by the invaders became famous under the name of "Ido bowls"; they were used in the tea ceremony by some of its most famous devotees and have been preserved as part of the Japanese national heritage. In modern times Yi period pottery has inspired leading potters in Japan and England.

Among the noteworthy productions of the latter part of the Yi period were such minor works of art and handicrafts as chests and caskets of coarse red or black lacquer inlaid with mother-of-pearl and many types of brassware, wood carving, and furniture. Folk arts continued to show surprising vigor even after the annexation by Japan in 1910 and have won high praise from scholars and artists.

KUCHA. In the field of Central Asian art (see ASIA, CENTRAL), the products of the city and oasis of Kucha (in Chinese, Ku-chich, but called "Küsän" and "Kujā" by al-Kāshghārī) can be recognized as having a particular character of their own. Kucha was one of the most important caravan stops of the Tarim Basin and was the capital of the small state of Kucha and the seat of a sophisticated culture particularly inspired by Buddhism (q.v.). Although the most salient aspects of the art of Kucha is the reinterpretation of elements drawn from other cultures, original features do exist, mingling with influences from Gandhara (q.v.), India (see INDIAN ART), and Sassanian Iran (see SASSANIAN ART).

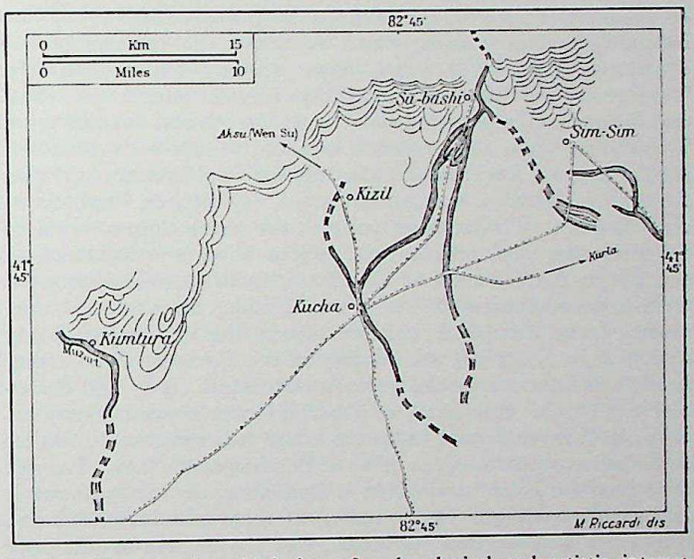
SUMMARY. Introduction (col. 1029). Relation to Tumshuk (col. 1029). Relation to Karashahr and Shorchuk (col. 1031). Temple architecture: Duldur-akhur and Su-bashi (col. 1034). Rock sanctuaries: Kizil and Kumtura (col. 1035). Styles of painting (col. 1037).

INTRODUCTION. The oasis of Kucha fostered a notable artistic culture of which only the most significant part has been studied: the rock-cut temples of Kizil and Kumtura and the temple buildings of Duldur-akhur and Su-bashi, as well as those of Kizil-Karga (or Kizil-shahr), Hisar, Sim-Sim, Kirish, Ačiġ-Iläk, and in other less important areas. Sites of less interest, such as Tonguz-bash, have been noted by Pelliot and other archaeologists, but these have been neither studied nor excavated satisfactorily. This complex, certainly one of the most remarkable archaeological finds of innermost Asia, cannot be studied nor its artistic discoveries properly interpreted without considering it in relation to two other sites: Tumshuk to the west and, to the east, Karashahr (Qara Shahr) with its adjoining sites, the most important of which is Shorchuk (also called Shikshim).

Greco-Buddhist influences came to Kucha through Tumshuk from Taxila, as well as from Hadda and Fondukistan, and probably passed through Gilgit to reach the northern Silk Route through the Tarim Basin, no doubt like the Greco-Buddhist influences that came from Bamian by way of a more northerly route. Unfortunately, only fragments of wall paintings are preserved at Tumshuk, and although these paintings most likely represent a distinct stage of development, the fragments are too incomplete for sufficient evidence. Chinese influences, on the other hand, came to Kucha through Shorchuk; Kumtura represents the extreme western limit of the advance of Chinese culture along the north Tarim route. The influences active at Kucha in various periods and places were indeed complex; the mark of Sassanian Iran and India is especially noticeable in the earlier works, while Chinese influence predominates in the later period, corresponding more or less to the political conditions of the Tarim Basin, which periodically was subjected to Chinese rule. A brief description of Tumshuk and Shorchuk will explain how the art currents of Kucha arrived there.

RELATION TO TUMSHUK. Tumshuk, located between Maral-bashi and Aksu, is a vast monastic complex established in the northwestern section of the Tarim Basin at the base of a rocky spur, from which the Turkish name Tumshuk ("beak" or "promontory") is taken, replacing the now unknown ancient name. Long after the destruction of the monastery, a Moslem village, later moved east of the pass, was established here; a cemetery, the ruins of a house, and a *mazār* (tomb of a Moslem saint) remain on the site. The Buddhist center is quite complex, comprising three settlements, two of which were originally discovered and excavated by Pelliot and the third by Von Le Coq. The first two are situated on either side of the pass through which the road from Maral-bashi to Aksu crosses the chain of peaks. One of the two centers, Tokuz-saray, is the most important site; it rises on a plateau that dominates a valley which can be reached from only one side by a gentle slope. The other two centers were built on sheer cliffs, one of them even having been cut into the rock at the southwest end of Tokuz-saray. For lack of a better name, Pelliot also called the second site Tumshuk; it consists of ruins of a complex of sanctuaries located south of the pass at the northern end of Tumshuk-tagh (the Tumshuk oasis), which lies somewhat east of the pass on the Aksu road. The third site, explored by Von Le Coq, is located at the southern end of Tumshuk-tagh, and bears the name Tumshuk-tagh-shahri (the city of the Tumshuk-tagh).

At the time of the Pelliot–Von Le Coq explorations only ruins buried under mounds of debris remained at the three sites. At Tokuz-saray, buildings had been erected during the Moslem period — that is, beginning in the 10th or 11th century at the earliest — and a Moslem cemetery established in the midst of the ruins, with the graves adjoining the remains of the destroyed buildings. (The sanctuaries and monastic buildings had been demolished and burned, a fact that led the archaeologist Sven Hedin to suggest that the site dated from a late period.) Apparently a very important center existed in this region, since numerous ruins stretch over a large area east of Tokuz-saray. The ancient irrigation canals which watered the fallow sand-covered lands show how large a population once lived in this region, but there is nothing left from which it might have been possible to tell when the population disappeared — whether it was decimated in the course of the many wars which



Kucha region, showing chief sites of archaeological and artistic interest.

took place in the Tarim Basin, especially in the time of Tamerlane, or whether it was dispersed for reasons yet unknown.

The Buddhist period seems to have lasted a long time, but the destruction of the buildings of that era was so thorough that only the foundations of religious monuments and monastic structures remain. Important archaeological material was discovered here, finds which help to establish the dates of the period when the religious communities flourished. Chinese texts studied up to now have yielded no information about the site, for — unless it was called by another name — it is not even mentioned. Only one Tibetan document from Tun-huang (q.v.) apparently mentions Tumshuk under the form *t'um-c'u*, although it seems unlikely that the name Tumshuk existed at so early a period, since that is actually the Turkish name of the site. It must have had an Indo-European name before its occupation by the Uigurs or by the Oghuz (Ghuz). Perhaps a study of the documents written in Brahmi script discovered at Tumshuk may indicate a more exact date. However, the objects discovered in different sections of the ruins vary so in style that it must be concluded that they belong to different periods.

According to Pelliot's excavation notes, "the terra cottas of Greek type from the little Temple I do not belong to the same period as the purely Indian bas-reliefs on the earthworks; they are even less contemporary with the statues of *torchis* [or cob, a mixture of vegetable fibers and clay or gesso], so typically Chinese, decorating the central stupa, and mark a step backward, an artistic decadence." There are many important archaeological remains, including several panels from a relief series decorating the principal sanctuary, which seem to represent Bud-

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

dhist scenes that are still unidentified. One depicts an emaciated figure with a Brahman; another shows a seated divinity above whose head are flying two devas or apsarases (I, PL. 472). On a third, a divinity with a nimbus is shown with a young woman on his left and an old woman on his right, both women with nimbi. To the right of the old woman, a figure carries on his shoulders a burden which is difficult to identify, and a young woman attendant is seated at his feet. Aside from these panels, which constitute the major documents, numerous fragments of statues which had adorned different portions of the sanctuary and the stupa were discovered. In the complex of buildings where these remains were found, several temples can be distinguished, as well as altars decorated with bas-reliefs, of which only fragments remain. A low balustrade with elephant heads was found north of the stupa, while other elephants from reliefs were found inside the buildings.

Except for fragments of arms and torsos, most of the material consists of heads from large statues or from bas-reliefs broken by the Moslems and scattered about (I, PLS. 476, 477). According to Pelliot, the statues must have been painted or covered with gold leaf; they show a considerable amount of variation. The cult images, which represent the Buddha or bodhisattvas, were very large, some actually larger than life. They reveal the influence of a highly evolved sculpture and must date from the T'ang period — between the 7th and 8th centuries. The figures from the broken bas-reliefs, which were doubtless similar to those few reliefs that luckily survived in entirety, depict figures of all types: monks, divinities, lay figures, barbarians, and demons. The stylistic sources for these figures seem to be numerous and problematic. Some show the influence of the Greco-Buddhist art of Gandhara, although resembling the terra-cotta sculpture of Taxila and Hadda; these pieces come mostly from Temple I and are clearly the earliest, probably dating from about the 4th century of the Christian Era. Other heads and busts show the influence of Gupta (q.v.) and Sassanian art (q.v.). One head, of a barbarian or a yaksha, may reflect a still more distant influence, since it is remarkably similar to the silenus heads on the coins of Panticapaeum (mod. Kerch). Still another head, draped in a lion skin, distinctly shows a Hellenistic heritage. Other materials recovered include fresco fragments and wooden statuettes, but since these are in poor condition and relatively scarce, definitive conclusions concerning them cannot be drawn.

At Tumshuk the most varied influences were brought together during the long period before its destruction, a fact which makes this site an especially rich source of knowledge. Pelliot's discoveries there are of great importance, since this site provides the link connecting Kucha and the other eastern Serindia centers to India and the West. The work done by Von Le Coq, in the course of which complete objects as well as fragments were discovered, confirms these relationships.

RELATION TO KARASHAHR AND SHORCHUK. Karashahr, which includes the important complex of temples and monastic establishments called "Shorchuk" by German archaeologists and "Shikshim" by the Russians, was originally the seat of an Indo-European state and was known as "Yen-ch'i" (Yenki; or "A-chini", Agni). It later became Uigurian and was called Karashahr, meaning "the Black City." Chinese influences penetrated into Kucha via Karashahr. At the same time, Western influences traveled to eastern Serindia through Karashahr and entered China (q.v.) during the T'ang era. While the city of Karashahr has yielded few archaeological remains, Shorchuk, located 16 miles south-southwest of the city on the rolling heights above the loess plain, contains a considerable complex of Buddhist ruins, near which are located rock sanctuaries. The ruins include over a hundred sanctuaries, ranging in type from a miniature cella, from 4 ft. to 6 ft. square, to massive rectangular buildings with an 80-ft. side built of sun-dried bricks reinforced by wooden beams.

The influence of Khotanese architecture (see KHOTANESE ART), particularly that of Dandan-uilik, is reflected in the sanctuaries of Shorchuk. Some of the buildings are similar to stupas with cylindrical domes, except that they are hollow; they resemble the buildings of the cemetery in Kosh-gumbaz (Qosh-gumbaz) near Khocho (Kara Khōja) and served as tombs or shrines, as is indicated by the cinerary urns and boxes found inside. The most common type is a sanctuary of medium size formed by a cella with a small, narrow vaulted chamber behind the wall facing the entrance. Low vaulted entries into this space permitted circumambulation around the principal image, which faced the main entrance. This little room or passage may have been decorated with frescoes or stuccoes. Such a plan is strikingly similar to the cellas of the rock sanctuaries of the second style in Kizil (Qizil). The monuments in Shorchuk, mostly derived from types found more toward the west, provide a new architectural link between the Turfan and Kansu ruins and the Tarim Basin sites.

The same is true, in part, of the decoration, which also derived most of its motifs from the more westerly sites, but which nevertheless absorbed considerable Chinese influence through Turfan and through the Kansu centers. Among the paintings that survive, those on a section of the vault and on the walls of a corridor in Sanctuary XIII, as well as those in several caves, deserve special mention. The paintings in the passageway in Sanctuary XIII depict a group of monks around their master, or writing in caves surrounded by trees, or teaching their disciples, while genii fly about scattering blossoms or gandharvas float above them on clouds, Other scenes show monks ascending on clouds, as disciples and divinities kneel in adoration, or descending on clouds, as seated or kneeling monks watch the approaching arhat. These paintings seem to be quite late, undoubtedly belonging to the Uigur period; they are completely Chinese in their general appearance.

Cella VII yielded a painted wooden panel, similar to those from Khotan, portraying a bodhisattva seated in European fashion (i.e., with his feet hanging) below a flattened horseshoe arch. Like the paintings of other bodhisattvas, this panel clearly shows Indian influence. On the other hand, a fresco fragment discovered in Sanctuary XVIII depicts a typically Chinese subject: a dragon similar to those in the Bezeklik and Khocho sites is shown emerging from the water to attack a man who is about to cross the water, which barely reaches above his bare feet.

The cave paintings show the same mixture of influences; they can be considered as a transition between the second and third style of the Kucha region, with variations in thematic representations. The scene of the bodhisattva feeding himself to the hungry tiger and her young, a subject also found at Kizil, can be seen in Cave III. The *Parinirvāṇa* in Cave IX shows a change in the representation of Vajrapāṇi, who is shown flinging himself face down upon the ground and releasing his thunderbolt. More important differences are evident in other paintings. The Indian princes assisting at the division of the relics wear different clothes, and architectural details such as doors, windows, and walls are no longer the same. The soldiers of Māra, participating in the Assault on the Buddha, are dressed in a kind of coat of mail formed by rows of plaquettes, examples of which are found in the statuary of Shorchuk, as well as that of Dandan-uilik (Sanctuary D II); it is similar to the lacquered leather armor found in the Tibetan fortress of Miran, which lies east of Khotan on the southern Silk Route. The arrangement of the plaquettes is like that on the armor of a soldier of Māra in a Gandharan relief (Lahore, Central Mus.), a distant reminder of Greek armor. The donors depicted do not resemble those at Kizil but are similar to those of the Kumtura caves XIV and XXXIII; many are of Uigur type and their costumes are somewhat like those of donors found in Turfan paintings.

Such examples point to the complexity of influences on the paintings found in these sanctuaries, representative of the art of Kucha but often with significant variations derived from Chinese influences brought from Turfan. While Kizil paintings have light, brilliant colors, those at Shorchuk are rich and deep in color, with yellows, browns, roses, and greens predominating. The decorations on the vaults of rock sanctuaries recall the arrangement of Cave III in Kizil, with its large band of floral decoration surrounding bodhisattva medallions. The latter is Chinese in inspiration and similar to that of the caves of Kumtura's third style.

1033

The statuary in Shorchuk is as rich and varied as its painting. Besides the many examples of stuccowork, there are also numerous fragments of carved wood. Many clay molds were found, which show how various parts of the statues — heads, torsos, and limbs — were first molded in clay and fitted on a crude skeleton. They were then attached to the wall and finished by hand with a chisel, and finally painted and gilded. Since similar molds were found in Tumshuk and Kucha, it is obvious that this process was commonly used at least on the sites in the north Tarim Basin.

The site of Shorchuk may be divided into two sectors, the southern zone, known as Ming-oi, and the northern zone. Many stucco reliefs were found in Ming-oi. A colossal arm of a lokapala decorated with the head of a monster was discovered in the cella of Group I (Stein's classification). There are other similar examples. Cellas I and II of Group II contained various fragments, which included a well-modeled head of a buddha, a terra-cotta plaque with bead decoration, and a beautiful head of a bodhisattva wearing a flowered diadem and earrings of the Tumshuk and Kucha style. The remains of a flowered stucco frieze, attached to the wall by wooden pegs, were found in the corridor of Cella XXVI of Group II. There were also excavated numerous urns containing the remains of human bones and two crudely made little boxes in which there were cloth-wrapped bone fragments.

In the northern zone, especially in the northwest, excavation was even more rewarding, for the central terrace is occupied by several important temples, of which buildings X, XI, and XII yielded the richest finds. Cella XI contained numerous stucco fragments of varying importance. These had been preserved by a fire which hardened them but which, unfortunately, destroyed most of the colors. Decorative friezes must have been attached to the walls throughout the building. Large statues apparently did not exist, for no traces of them were found. The surviving fragments, consisting of numerous bodhisattvas of varying types and sizes, are in poor condition but show considerable artistic skill. A marked Gandharan influence is evident in the portrayal of genii and other celestial beings and of emaciated figures clothed in rich garments. Other less important fragments were also found; heads of statues — the bodies gone — were probably preserved because they had been hardened more quickly by the fire. Many of these heads are freely treated in a naturalistic style very different from the hieratic and conventional influences found elsewhere. This style is especially evident in some bearded heads, based on classical models transmitted through Gandhara. Often heads from the same mold were varied by modifying the hair style or by adding a different turban, diadem, beard, or mustache. The shape of the eye was altered to produce a great variety of expressions. These methods allowed expressions of emotion — rarely found in Gandharan art — to show in the faces, as seen, for example, in the head of an old woman laughing, in that of a weeping man, and in a grotesque half-man and half-animal vomiting forth a skull.

The fragments of sculpture decoration found in the chamber behind building XII consisted of groups of richly draped, nearly life-size statues in high relief, arranged on low platforms along the exterior walls at the northwest and northeast corners; small reliefs that had fallen from a stucco frieze attached to the north wall; and statuettes, found at the feet of one of the statues of the northeast group, which undoubtedly represented donors.

In buildings X, XI, and XII other statue fragments were found, some of warriors, of which only the heads remained (covered with scale armor like the statues in the Tibetan fortress of Miran and in the region of Khotan), others representing a Gandharan type of bodhisattva. Near these human figures were found stucco fragments of animals skillfully modeled in a naturalistic style, among them the head of a camel and the legs and body of a horse reminiscent of the horses in T'ang sculpture. In other sanctuaries pieces of carved wood were found, including a fragment of a round box — similar to those found in Kucha — which may have contained relics; a fragment of the border of a large aureole, like examples discovered in Kucha and Rawak; and a lokapala in the T'ang style. The influence of the art of Gupta and Gandhara predominates in most of these fragments; the small statuary recalls that of Hadda and Taxila but is more stylized than the Tumshuk sculpture, while the elegance of the bodies and the anatomical details visible through the garments, derived from Gupta art, at times contrast with the painted decoration, which is frequently Chinese in style.

Shorchuk and Tumshuk are the connecting links between Kucha and the great cultures of northwest India and China. In the course of almost ten centuries an eclectic art evolved in Kucha which, while not great, is important, especially in the context of the area in which it developed, a region continually menaced by nomads.

Since it is impossible to examine all the sites which make up the complex of Kucha, only the most important are discussed below: Duldur-akhur and Su-bashi for examples of temple construction, and Kizil and Kumtura for their rock-cut temples.

TEMPLE ARCHITECTURE: DULDUR-AKHUR AND SU-BASHI. Duldur-akhur, on the right bank of the Kucha River, is essentially a monastery complex, with its buildings arranged around a central court. Su-bashi forms a complex at the point at which the Kucha River exits from the Chöl-tagh; it consists of rock sanctuaries and of several monasteries on both banks of the river.

Besides the monastery buildings, the site of Duldur-akhur also includes isolated stupas. Unfortunately, the complex of buildings has been burned, and the stupas have been partially destroyed by treasure hunters. It is likely that the monastery was pillaged before it was burned; this is indicated by spots on the frescoes from which the gilding has been scratched. Much archaeological material was recovered by the various missions working in the ruins: fragments of murals and of statues made of cob, pieces of carved wood, and some examples of sculpture still classical in appearance (I, PL. 473). It is not possible to reconstruct the architecture of this monastery, but it seems that on the whole it resembled the monasteries of Gandhara.

Among the fresco fragments several can be considered characteristic in spite of their small size. One fragment includes a pair of forearms and the palms of the hands, apparently clasped against the chest; the garment is patterned with multicolored flowers, and the figure wears bracelets and a necklace. The same bright colors, rosy ochre and light green, were also used on another fragment which shows two feet close together below the lower border of a garment. The colors and the variety of the styles indicate that these paintings — like those on other fragments, including one with an ascetic or a Brahman — were part of a group formed over several centuries; perhaps some are quite late. Some are close to the first style at Kizil, while others are touched by the Chinese influences present in the Tarim Basin from about the 8th century on.

The statuary includes many more examples with classical overtones. Several beautiful pieces of sculpture found within the ruins of one isolated stupa include: the head of a life-size stucco bodhisattva, classical in appearance, wearing a laurel crown over a coiffure of thick curls; and another slightly smaller head, also with a laurel crown and with hair arranged in more formalized waves, its face covered with a white coating which remains in some spots, while traces of black paint emphasize the hair, eyebrows, eyelids, and mustache. The wooden sculptures — which include statuettes, fragments of aureoles, and decorative objects — must have been painted and gilded, as indicated by the traces of gilding and paint that remain on a buddha's raised hand. The aureole fragments clearly show Chinese influence. Other statues, very skillfully carved, show the influence of Gandhara and perhaps even of the art of the Steppes (see STEPPES CULTURES), as can be seen, for example, in the figure of an open-jawed griffin of a menacing appearance. On the other hand, a vase fragment with a dark green glaze, decorated with a grotesque mask within a circle of beading, shows Western influences; the mask derives from the Gorgon motif and the beading is also of Western derivation.

Su-bashi absorbed even more varied influences, judging from the art found there, including frescoes in many styles, photographed *in situ* by Pelliot and studied by Hackin. One of these frescoes, in a good state of preservation at the time it

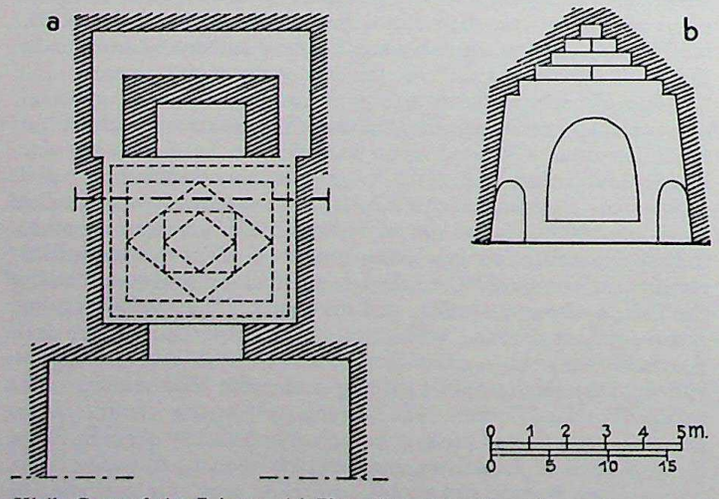
UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

was photographed, demonstrates how highly developed this art had become, as well as the influences at work in its formation. The fresco shows a bodhisattva surrounded by musicians and other figures, the entire scene framed by a frieze formed by a row of rosettes. Both Indian and Sassanian influences are clearly evident, suggesting that this fresco dates from a period no earlier than the end of the 4th or from the 5th century, the date of the first Kizil style. The stuccoes show distant influences, harking back to Greek prototypes, perhaps transmitted via Hadda. To these influences were added those of Gupta art, as is suggested by the elegance of the forms and by the *tribhaṅga* ("three-bends") pose of some of the figures. This pose may be seen in certain thin figures — actually made in molds, but nevertheless giving the impression of having been freely modeled — which appear to have been executed with great spontaneity and may even have been left unfinished intentionally. The rhythm of the drapery and the slenderness of the forms are especially remarkable in a dancing female figure with arms and legs akimbo, in a female torso with hips slightly outthrust, and in a fragment of a nude torso partly covered with a supple, free drapery. This art is extremely refined and complex, but since extant examples of it are so scarce, it cannot be analyzed with any degree of certainty (I, PL. 476).

ROCK SANCTUARIES: KIZIL AND KUMTURA. The rock sanctuaries of Kizil and Kumtura afford much rich material for the study of their art and architecture. The sanctuaries are particularly remarkable for the number of frescoes that survived (PLS. 401, 402, 404, 405; I, PLS. 471, 474, 475, 478–481, 483, 484); statuary is represented only by a limited number of painted mold-made pieces. As with the Romanesque churches of the West, the purpose of painting was not only to decorate the walls but also to instruct the faithful. Also as in the West, sculpture was painted, as is proven by certain statuettes from Kumtura (PL. 403) and by many stuccoes from Shorchuk.

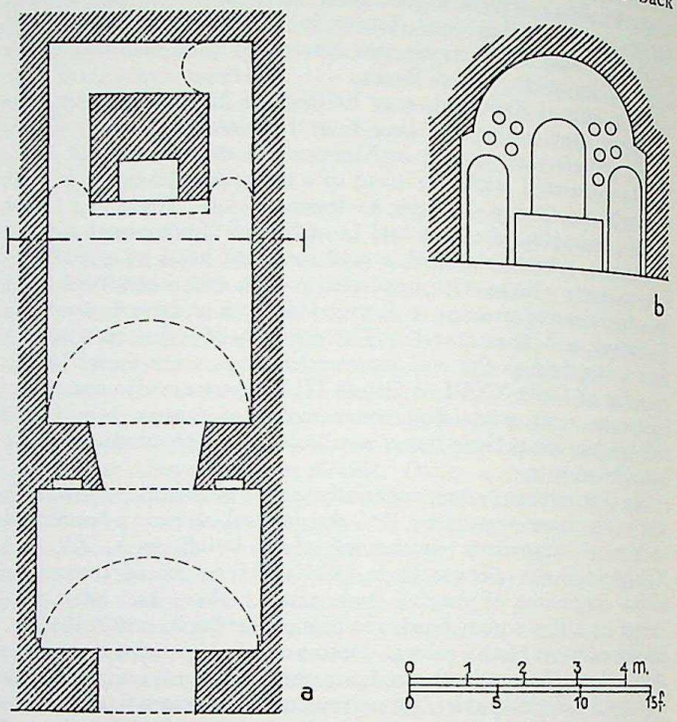
Three architectural types are represented in the rock sanctuaries of Kizil and, in different proportions, in Kumtura, where the only free-standing temple structure was found (see ASIA, CENTRAL). Two sanctuaries at Kizil and one at Kumtura, where the influence of Chinese T'ang painting (see CHINESE ART) prevailed, can serve as examples of the three most characteristic styles in Kucha art, which developed approximately during the period from the second half of the 4th century to the end of the 8th century. After absorbing the influence of India and Iran, this art seems to have undergone considerable change,



Kizil, Cave of the Painter. (*a*) Plan; (*b*) section (*from A. von Le Coq and E. Waldschmidt, 1922–33*).

developing elements characteristic of the art of the entire Tarim Basin. Beginning with the 8th century, tremendous waves of Chinese influence arrived, profoundly changing the art until the time of its disappearance.

Among the sanctuaries containing paintings in the first style (mid-4th cent.–mid-5th cent.) one of the most characteristic is the Cave of the Peacocks. It includes a main hall, wider than it is deep, the portal of which must have formed a vestibule, and a second hall entered by a rather deep doorway, of which a portion of the frame still survives. Three steps lead to the second hall. The main cella is rectangular, with a flat ceiling in the midst of which arises a cupola about 5 ft. high. At the back



Kizil, Cave of Māyā. (*a*) Plan; (*b*) section looking toward the rear wall (*from A. von Le Coq and E. Waldschmidt, 1922–33*).

is a base that must have supported the cult image. On the wall adjoining the front entrance, there is a painting of a divinity holding a club, behind whom are shown only the feet of a figure and a horse. Nothing remains on the other wall. On the side of the main hall, to the left of the entrance, there is a large scene with figures larger than life size representing the Assault of Māra. The image of the Buddha is well preserved; there are three animal-headed demons in front, while on one side are shown demons attacking the Buddha and, on the other, demons fleeing or being hurled to earth. Below the Buddha, Vasundharā is depicted in the form of four little figures emerging from a lotus blossom. On the opposite wall and in the same scale the Sermon at Sarnath was represented, but this fresco has almost totally disintegrated.

The cella is decorated on the ceiling and in the dome as well as on all the walls. The dome is painted with peacock feathers at the base, and a rosette, which later fell, was once attached by three pegs at its center. This rosette has a border and is divided into six segments, on each of which a putto is painted. The putti wear aureoles and a rather unusual hair style, partly shaven, and are shown flying downward, holding a necklace. *Devaputras*, with arms uplifted as if supporting the cupola, are painted above the door and on the other three sides of the ceiling. Each corner has a bodhisattva with a large *parivāra* (retinue). Wherever the paint is preserved on the walls of the cella, it can be seen that the upper portion had a border — representing a balustrade — with a seated bodhisattva in the middle and a *parivāra* composed of delightful figures of devatas with musical instruments and flowers, and of *devaputras*. On the balustrade extend three bands representing, in a series of pictures as wide as they are high, scenes from the Life of the Buddha according to Indian iconography (see BUDDHISM; BUDDHIST PRIMITIVE SCHOOLS).

The second style (6th–8th cent.) of the art of Kucha is exemplified by the Cave of the Sixteen Sheaths, which contains well-preserved typical paintings with harsh green and lapis

UP State Museum, Lucknow

lazuli as dominant colors. Its architecture is simple, consisting of a single rectangular hall with a barrel vault. In the back, the sanctuary was carved out around a pedestal hollowed out like a niche for the cult image; an ambulatory was formed around the pedestal by hollowing out the wall behind it. There was a row of stucco figures on the upper part of the wall, above a wooden balcony, of which traces of the supports remain.

The vault is decorated with alternating series of Buddhas and bodhisattvas against a stylized mountain background, with more or less recognizable representations of the Jātakas and the Avadānas. The paintings on the top are characteristic of Kizil. In the center is a two-headed Garuḍa holding serpents in his beak. Buddhas, surrounded by flames, are shown on each side, and at either end, the sun and the moon — the sun as a brownish-red disk with a blue and white border, the moon as a white disk with a brownish-red semicircle surrounded by little circles representing stars. Near an isolated pillar in the rear passage, the Distribution of the Relics of the Buddha is depicted. The Brahmanic Droṇa, a legendary ruler, is pictured according to Indian tradition; he is shown distributing the relics to representatives of the various Malla tribes, here portrayed as Central Asian warriors in armor riding stirrupless on horseback, their feet pointing downward. The paintings in the back part of the cella were destroyed, but those on the sides of the corridors represent richly dressed donors. The walls at the end of the cella are covered with paintings of the Preaching of the Buddha, and the lunette over the door preserves a portion of a scene depicting flying figures, bearing offerings or playing lutes.

At Kumtura, in the Cave of Nirvana, both painting style and architectural type are different. The shrine is formed by a rectangular cella with a base bearing the cult image and a passage hollowed out around it. Rows of monks and lay figures are painted on each side of the door. On the cella vault there are pictures of Buddhas, surrounded by devatas, looking toward the back of the cave. The intervals are richly decorated with clouds and floral ornaments. Corridor vaults are treated as a continuation of the cella vault and have the same floral motifs. The front of the niche shows the Assault of the Buddha, in the Chinese manner. Each of the side walls of the cella had two niches with relief groups of bodhisattvas, probably surrounded by other figures. The walls of the niche were also decorated, and the back of the cella, behind the cult image, was adorned with wavy superimposed stripes, a characteristic decoration of this period. The walls of the passage show images of bodhisattvas, some of which, according to Grünwedel, show elements of the best types of ancient Japanese art.

STYLES OF PAINTING. The paintings of Kizil and Kumtura represent a composite art. The first style shows signs of uncertainty or, rather, of experimentation; its subjects and arrangement of details seem to have followed certain rules, unless a ritual order had to be used. The influence of Gupta art and of the Irano-Buddhist art of Bamian, quite distinct at first, gradually fused into a more individual art which found full expression in the second style. In the first style, the colors are soft and lack contrast, and the modeling gives an appearance of depth because of the shading, which follows the contours and underlines certain details, thus creating an effect of roundness. In the second style, colors are often contrasting and violent, and a sharper linear style finally resolves itself in a cursive, summary treatment in which the effect is gained by means of line rather than volume. The second style often sacrifices quality to dramatic effects, but the composition remains balanced. At this point, an art peculiar to the Tarim Basin was in the process of being formed; it depicts an ethnic type characteristic of the region, the figure slightly stocky but preserving the rhythms and grace of its Indian prototype (PL. 405), and there is a characteristic arrangement of the decorative elements. This development took place during the period when Serindia was free from Chinese rule — from the fall of the later Han protectorate until the T'ang conquest in the 7th century. Then the Chinese invasion carried into the region its own strong influences, the importance of which decreases from east to west. This influence, which flourished at Kumtura, pervaded Khotan on the southern Silk Route and lasted until the fall of the T'ang dynasty in the 10th century. It was then too late for the art of the Tarim Basin to regain its unique personality. The Moslem conquest gradually brought about its end, but it remained for a time among the Uigurs, who had already been strongly influenced by China.

Illustrations: PLS. 401–405; 3 figs. in text.

KU K'AI-CHIH. Chinese painter (ca. 344–ca. 405) born at Wu-hsi in the province of Kiangsu. Although history records the names of various Chinese artists who attained prominence during the early centuries of our era, Ku K'ai-chih is the first concerning whose life and work anything of consequence is known. Later generations enthroned him as one of the chief patriarchs of the Chinese school; as a painter of the human figure, he seems to have been the forerunner of the great masters of the T'ang period (618–906).

Ku painted at least one work for a Buddhist temple, but was especially noted for his secular portraits; his recorded hand-scroll compositions, commonly executed in Chinese ink and color, include historical subjects as well as Taoist legends represented in a landscape setting. Early accounts praise the dramatic force of his conceptions, his fluent, linear brushwork and telling use of color, and above all the singular skill with which he portrayed human character — perhaps his most original contribution to the progress of the art. The authenticity of the works long attributed to Ku is extremely questionable, but there are in existence several ancient scrolls which have long been associated with his name and which certainly preserve the spirit of a strongly individual style. The most important of these, *The Admonitions of the Instructress to the Court Ladies* (PLS. 406, 407; III, PL. 235), may be among the oldest Chinese scrolls extant. In execution it comes close to the supposed conventions of the pre-T'ang period, but there has been much subsequent restoration, and opinion remains divided concerning its actual date.

According to the *Chin-shu*, the official history of the Chin dynasty — which, although compiled only at the beginning of the 7th century, incorporates records dating back almost to the painter's lifetime — Ku K'ai-chih was born at Wu-hsi and lived to the age of 62. Early in life he served as military secretary to the Grand Marshal Huan Wên (312–73), and since a further appointment is recorded for the year 405, his life span must correspond roughly to the years 344–406. He was subsequently on terms of intimate friendship with Huan Wên and also with Yin Chung-k'an, prefect at Ching-chou in Hupeh.

Ku was a popular figure of the day, and his reputation as a wit is reflected in various telling anecdotes. Someone commented of him that as a young man he was "composed half of real madness, half of conscious buffoonery: one cannot understand him properly without making allowances for both." At the same time he is credited with wide erudition and no small opinion of his own literary talents.

Ku K'ai-chih's place in the history of Chinese art is clearly affected by these indications of his lively personality, but account must also be taken of the novel intellectual climate in which he lived. By this time the formerly powerful Chin state had become confined to the region of the lower Yangtze River valley, and the northern provinces were torn repeatedly

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

by feudal rivalries and barbarian invasions. For several centuries, therefore, this enlightened southern court at Nanking was to serve as the chief repository for the traditions and culture of the preceding Han dynasty (206 B.C.–A.D. 221). Already, however, the rigid system of Confucianism (q.v.) established in that era, which laid down strict rules for the conduct of affairs of state and society alike, had undergone a marked mollification at the hands of scholars influenced by mystical Taoism (q.v.).

One effect of this on literature and art was a considerable broadening of the individual imagination. Ku's participation in this trend was reflected in many aspects of his life and work, not only in his belief in magic and the Taoist cosmology but also in his keen interest in natural phenomena and the human emotions. He was, in effect, the first exemplar of that observant philosophical and literary approach which has ever since directed the main course of Chinese painting.

Ku K'ai-chih's earliest known work is a remarkable picture of the Buddhist hermit-saint Vimalkīrti, painted in his youth for the Tile-Coffin Temple at Nanking, and this, it is said, laid the foundations of his later reputation. The 9th-century critic Chang Yen-yüan, in his famous *Li-tai ming-hua chi* comments as follows: "In the painting of the wise old men of ancient times only master Ku mastered its vital principles . . . . He was the first to make a picture of Vimalakīrti which has well-defined and emaciated features that plainly show his illness. Lu and Chang both tried to equal this portrait but never did so." [Lu T'an-wei (5th cent.) and Chang Sêng-yü (see CHINESE ART) were the two foremost pre-T'ang painters whom critics ranked with Ku.] But Ku was no less noted for the verisimilitude of his secular portraits; and among various fragmentary writings attributed to the artist, which are incorporated in Chang Yen-yüan's work, the following remarks on his approach to the art of portraiture are especially revealing: "Once you have arranged the accessories on which the sitter's gaze is directed, you must not move them. Men do not wave a friendly hand or look interested when there is nothing in front of them." This passage implies psychological insight as well as the study of gesture and movement.

The same characteristics may be noted in Ku's more ambitious works, among which were a variety of compositions on themes already traditional. The subject of the *Admonitions* scroll, like that of the *Heroines* or *Illustrious Women*, was one of moral instruction with a strong Confucian flavor, yet its interpretation was apparently distinguished by a keen, almost cynical personal observation. It seems highly probable that the Seven Sages of the Bamboo Grove, a coterie of eccentric scholars prominent in the advancement of Taoist philosophies during the post-Han era, provided a motive more sympathetic to his own ideals.

Another painting of Taoist inspiration is described in an essay entitled *Hua yün t'ai shan chi* ("On Painting the Cloud Terrace Mountain"), the most lengthy of Ku's writings preserved by Chang Yen-yüan and the most valuable for the appreciation of his artistic aims and methods. This mountain was the scene of the legendary activities of the Taoist magician Chang Tao-ling, who came to be regarded as the first Taoist *t'ien-shih*, or patriarch. It was the setting therefore for a dramatic illustration of scripture rather than a landscape composition of the type which was to appear later in Chinese art under the influence of poetry. The scene chosen for illustration is that of the ordeal of the disciple Chao Sheng, who is commanded to gather the fruit of immortality from a tree growing high on an inaccessible cliff face. Ku describes how the faces of the participants are to be charged with deep emotion, while each feature of the mountain landscape is disposed to accentuate the atmosphere of awe and dizzy terror. The prominence given to such purely symbolic elements as the mythical phoenix and tiger, the peach tree and pine, and the "felicitous clouds" which attract spirits underlines the essentially mystical nature of his conception.

In conjunction with other passages in Chang Yen-yüan's critical work, Ku's vivid essay provides not a few indications of the conventions and technicalities of painting in the period of the Six Dynasties. It describes, for example, various compositional devices designed to heighten the illusion of space and distance and speaks of realism in the presentation of details.

To represent the whole mountain within the picture space required, however, a tacit disregard for scale in the figures. The way in which such problems was resolved may usefully be studied in certain sections of the *Admonitions* scroll. Ku's use of colors, of which blue, cinnabar red, and purple are specifically indicated in his essay, appears well calculated for dramatic effect. His brushwork was predominantly linear and achieved life through its rhythmic movement, tracing a contour within which color could be applied flatly, while shading was kept to a minimum. Such an interpretation, at least, seems to be supported by comparison with tomb murals and other works of the period. According to Chang Yen-yüan, "his strokes are firm and tense and connect with one another uninterruptedly; they circle back upon themselves in sudden rushes. His tone and style are evanescent and variable, his atmosphere and interest lightning and sudden." The 6th-century critic Hsieh Ho, however, who formulated the renowned "Six Principles" of painting in his *Ku-hua p'in-lu*, thought Ku K'ai-chih famed beyond his merits; "His style and execution were refined and minute and he never used his brush haphazardly. But his works did not come up to his conceptions." From this, Ku's brush technique may be suspected of lacking that superior vitality which was the critic's highest canon of excellence.

Numerous other pictures have at various times been attributed to Ku K'ai-chih; nine are listed in the 12th-century imperial catalogue *Hsüan-ho hua-p'u*, but very few have survived and only the *Admonitions* hand scroll lays claim to be considered a pre-Sung version. Its attribution in fact dates back to this 12th-century work, but Pelliot (1933) has traced the history of its ownership to the 11th century. Of considerable length (11 ft., $4\frac{1}{2}$ in. × $9\frac{3}{4}$ in.), it is executed in ink and red and brown color, and shows signs of repeated restoration. The work comprises nine distinct illustrations to a moralistic tract of the same title by the poet Chang Hua (232–300), each accompanied by a descriptive text apparently added later. Two preceding sections and an introductory text are missing. The surviving themes (PLS. 406, 407; III, PL. 235) are: (1) Lady Feng rescues her Emperor from a bear. (2) Lady Pan refuses to ride in the Emperor's litter "lest she should distract him from state affairs." (3) A hunter in a mountain landscape ("In nature is nothing high that is not soon brought low"). (4) A lady adorning her person ("Few know how to embellish their souls"). (5) A lady in bed conversing with a bearded man ("If the words you utter are not good, even your bedfellow will distrust you"). (6) A large family ("Your race shall multiply"). (7) A lady reproached by her husband ("No one can endlessly please"). (8) A lady kneeling ("Fulfill your duties calmly and respectfully"). (9) The Instructress. Lively and harmonious, the figure compositions are executed with a sinuous, rhythmic line that, while it allows little emphasis of structure or mass, is nevertheless richly expressive in its rendering of the hands, face, and bodily movement. Undoubtedly, these are the work of a master of very early date.

Nevertheless Binyon's (1912) championing of the attribution to Ku K'ai-chih himself has not been widely accepted. Much of the subsequent discussion is conveniently summarized by Sullivan (1954), whose claim to have identified details characteristic of a 10th–11th-century execution may be contested on the ground that these are restorations. Not a few authorities (e.g., Sirén, 1956) favor an early T'ang date, although in Sickman's view no adequate evidence has yet been produced to support any of these comparatively late attributions.

Several other pictures connected with Ku's name show in their conception unmistakable affinities to the *Admonitions* scroll, the most important being two (probably Sung) versions of a scroll entitled *The Nymph of the Lo River* now in the Hui-hua-kuan, Peking and in Washington (PL. 408). The subject, which is again based on a 3d-century Taoist poem, depicts a host of heavenly creatures disposed in an ethereal landscape. (The order of the episodes should be viewed from bottom to top, in the reading order of Chinese.) In each case the somewhat still rendering has an archaistic, rather than

UP State Museum, Lucknow

merely archaic, flavor. The *Illustrious Women* scroll, likewise in Peking, is a composition in many respects close to the *Admonitions* in its grouping of figures, but in execution belonging essentially to the Sung period. So is the rather free version of *The Making of the Lute*, a work that perhaps deserves closer study than it has yet received, since its subject is recorded among the artist's œuvre.

KUSHAN ART. The name Kushan refers to an ethnic group of controversial origin and make-up (see GANDHARA). In the early centuries of the Christian Era this group gave rise to a great empire in whose area there arose various schools of art (see BACTRIAN ART; GANDHARA; INDO-IRANIAN ART; KHWARIZM; MATHURA, SCHOOL OF) inspired primarily by Buddhism (q.v.). The present article deals with the traits common to these schools and those formal and stylistic characteristics which the Kushans themselves contributed to the flowering of the various schools; in addition, by typological analysis of the art, it attempts to reconstruct the tastes of these peoples, which were in part responsible for the spread and continuation of both Hellenistic-Roman art (q.v.) and of anticlassical (Iranian and Central Asian) forms in the area of Indo-Iranian contacts and on the borders of Central Asia.

SUMMARY. The culture of the Kushan empire (col. 1041). Civil engineering (col. 1044). Architecture (col. 1045): *Fortifications; Urban centers; Dynastic sanctuaries.* Sculpture and religious monuments (col. 1047). Jewelry (col. 1048). Pottery and figurines (col. 1048).

THE CULTURE OF THE KUSHAN EMPIRE. The Kushans, perhaps one of the five principal seminomadic Iranian Yüeh-chih tribes that reached Bactria from the East during the 2d and 1st centuries B.C., became the leading political power in central Asia in the 1st century of our era. Further excavation may throw fresh light on the chronology of the Kushan rulers, but on the basis of current knowledge the first dynasty of Kujūla Kadphises (Kadphises I) and Wima Kadphises (Kadphises II) is dated to the 1st century of our era, and the second dynasty of Kaniṣka I, Huviṣka, and Vasudeva to the 2d century. Under Kaniṣka I the Kushan empire reached its zenith, covering an area limited by Mathura on the Jamuna River, the country of Turfan (q.v.), the oasis cities to the south of the Aral Sea, and the lower Indus Valley. After the Sassanian conquest (see SASSANIAN ART), the Kidara Kushans ruled semi-independently over a diminished area in the 3d and 4th centuries, until their defeat by the Ephthalites (White Huns). The Kushans not only sponsored great intellectual and artistic achievements in their dominions but were also in contact with the leading cultural centers of the ancient world, protecting the important overland route from Rome to China.

The Kushan civilization originated among peoples of mixed cultures. Their neighbors in the northern Eurasian steppes led a nomadic life and produced an art enriched by contacts with the Mediterranean world. In the Parthian borderland, ancient Iranian elements of the Achaemenid empire felt the impact of both the later Iranian nomadic cultures and of classic art (see IRANIAN PRE-SASSANIAN ART CULTURES). The southern neighbors of the Kushans on the Indian peninsula in the kingdoms of Magadha and Andhra (q.v.) had a mastery of architectural and sculptural techniques and an art which blended original and typically Indian features with elements of ancient Iranian, Mesopotamian, and possibly Mediterranean origin. Finally, land traffic and sea trade brought the Kushan empire into contact with the Hellenized civilization in the eastern provinces of the Roman Empire that reflected various art trends of western Asian (see ASIA, WEST: ANCIENT ART), Greek, and Roman origin.

The cosmopolitanism of the Kushan rulers favored an active exchange of all these esthetic ideas within the boundaries of its vast empire. The Begram hoard may symbolize the cultural aspects under which the Kushan empire flourished: in a deposit were discovered Indian ivories in the Mathura style (see IVORY AND BONE CARVING; PL. 241), Chinese lacquers, and bronze, glass, and plaster from eastern Mediterranean workshops (VI, PL. 220; VII, PL. 195). This material probably belonged to a customs post on the road from Bactria to India that branched off the east–west Silk Route. Foreign and indigenous artists, partly following older Asiatic traditions and partly inspired by Western models, were encouraged by tolerant rulers of syncretistic religion to create complex architecture, sculpture, and painting that united the content and form of past and contemporary arts of East and West. A great deal of this artistic achievement is ascribed to the individual energy of Kaniṣka I, who might be called a politician and Maecenas. In respect to Oriental cultures and those of the steppes, the Kushans represent the advance of a strong nomadic clan into Central Asia, bearing the art elements of the equestrian peoples. In relation to the West they represent the farthest descendant of Mediterranean culture. The developments of their art — sometimes similar and sometimes differing widely among the territories of Khwarizm (q.v.), Bactria (see BACTRIAN ART), Gandhara, and Mathura (qq.v.) — are all included by D. Schlumberger in the term "Greco-Iranian." More specifically, however, Kushan art is a part of early Indian architecture and sculpture, known for the famous workshops in Gandhara and Mathura; the foreign Western elements prevail in Gandhara, and the indigenous Asian ones in Mathura (PLS. 410, 412).

The Kushan artists enriched the Buddhist sculpture of India by the most important innovation of the period: the rendering of the Buddha in human form as a cult image or as a slightly oversized figure in the narrative reliefs (see BUDDHIST PRIMITIVE SCHOOLS; ICONOGRAPHY AND ICONOLOGY). The contact of the Kushan empire with the Greco-Roman world and its anthropomorphic deities may have accelerated the Indian evolution toward the use of the male figure rather than the earlier aniconic symbols (VII, PL. 412) to interpret the central cultic personality. (Lavish exemplification of the Buddha in human form is to be seen in the reliefs of Bharhut and Sanchi.) Probably at the same time the Gandhara Apollonian type and the Mathura Kapardin types of Buddha image were originated.

Two other phenomena of Kushan sculpture were not continued in later Indian art: the dynastic portrait and the colossal cult image. The portrayal of the individual was never a subject of Indian art, but the influence of Greco-Bactrian coins and Roman portrait sculpture seems to have inspired magnificent statues of Kushan rulers in the dynastic sanctuaries of Khwarizm,

Principal centers of Kushan culture. (1) Modern national boundaries; (2) remains from the Kushan period.

Surkh Kotal, and Mathura. This branch of sculpture was later without interest for Indian sculptors. The gigantic Buddha statues of Bamian, Kakrak, Ghazni, and Surkh Kotal may have been shaped after models of the late-antique period, but colossal cult images are unknown on Indian soil after the Kushan period, with the exception of the reclining Buddhas in Ajanta (q.v.) and Polonnaruva (Ceylon; see CEYLONESE ART; III, PL. 175) and the colossal standing images of medieval Jain art (see JAINISM).

The monuments of Kushan arts and crafts are a focal point between ancient Asian tradition and later Indian development.

Patterns of prehistoric Indus Valley pottery (see INDUS VALLEY ART) survive in Kushan works found at Rang Mahal (Bikaner dist., Rajasthan). On the very site of Mohenjo-daro a Kushan stupa was erected. In Toprak Kale and in Kashmir, wall paintings and stuccoes were executed in the Gandharan style long after the downfall of the Kushan empire. The Kushan capital of Mathura was erected over early historic settlements and later provided the basis for the planning of the modern town. At Toprak Kale, Tali Barzu, and Kandahar the Kushan layers represent just one chapter in a long historic record.

The sculpture of Mathura (PLS. 410, 412; IX, PLS. 379–384) preserves esthetic qualities of the Maurya, Śuṅga, and Early Andhra periods; enriched by Gandharan motifs, this art became the basis of Gupta art (see GUPTA, SCHOOL OF), with its manifold medieval derivations. After the Kushan dynasty Hindus and Moslems settled at Surkh Kotal. The diaper schist masonry known from Gandharan stupas and monasteries was used, toward the end of the 1st millennium of our era, by Hindu kings — who boasted of being successors of the Kushans — and by Islamic builders in the Kunar Valley and the Hindu Kush area.

The jewelry of Scythian character from Begram II is even nowadays in use among the central Asian and Indian populations. The Greek alphabet introduced by the Kushans in coin legends and epigraphs was transformed into a Greek cursive by the Ephthalites who finally conquered the Kidara Kushans.

CIVIL ENGINEERING. The greater part of the Kushan empire consisted of arid country, the cultivation of which was dependent on irrigation. Throughout Khwarizm during all periods of strong central government there flourished a well-developed

UP State Museum, Lucknow

1045

system of canals. It is surmised that the Kushans maintained the large canals existing in their dominions from the middle of the 1st millennium B.C., some of which lasted to about the 11th century of our era. In Bactria also, in the environs of Balkh and near the Kunduz and Khanabad rivers, there are the remains of a traditional canal system.

In the mountains of Swat the population had to face another problem: protection of the villages against floods and the collection of monsoon waters by barrages. A rare example at Tokar Dara of such a hydrological structure is especially interesting because of its diaper schist masonry.

Monuments of daily life from very remote times are scarce. The excavations by S. P. Tolstov supply at least one specimen of a rural settlement from the Kushan period: in the plain beneath the fortress of Ayaz Kale is a series of unfortified farmhouses. Mud-brick walls enclosed a very large court (perhaps a garden), and a small dwelling house consisting of 10 to 15 rooms was attached to one of the walls.

ARCHITECTURE. *Fortifications.* Fortified posts protecting economic centers and roads between the capital cities are found especially in the northern part of the Kushan empire. They were erected in the vicinity of the villages and the unfortified isolated farms. Together with the caravansaries they were placed along the overland communications to safeguard caravan trade. The mud-brick ruins of Ayaz Kale 1–3, Gyaur Kale, and Kunya-uaz represent the various types of fortifications that defended the northern border. One striking feature is the vast court behind huge mud walls, where the garrison was probably housed. The bulwark consisted of semicircular towers, vaulted corridors, and arrowlike loopholes. As far as present observations allow, it can be concluded that a system of fortified posts protected the traditional silk road along the route Shibarghan–Balkh–Tashkurghan–Kunduz–Khanabad–Taliqan and farther east. These posts were either rectangular structures in the open plain or polygonal walls in the curves of rivers and canals. The *tepes* (hills) are now of different sizes; common to all is a slight elevation in the center or at one corner — probably the watch tower of the garrison. Of extraordinary interest is the fortification of the south wall of Balkh, where Le Berre excavated earthen walls and profusely decorated mud-brick towers of the Kushan period, giving the outline of the Timurid fortress.

In the plains the type of small buildings was continued, while in mountain regions such as Doab imposing fortresses in diaper stone masonry dominated. In the Kabul plain and in the Logar Valley the unexcavated mound of Shahr-i-Sikandri and the small fortress of Saka indicate a similar defensive system. The mountains of the northwestern Indian frontier supplied abundant stone for the strongholds in the Kunar Valley and Swat, where fortified posts such as those on the cliffs of Chigha-Serai and Udegram remained in use long after the Kushan period. During the long history of ancient Kandahar, represented by extensive ruins, the Kushans seem to have played an important part. Dupree's excavations have demonstrated that during the Kushan period refugees from cities and villages in the Kandahar area several times found shelter in the Shamshir Ghar caves.

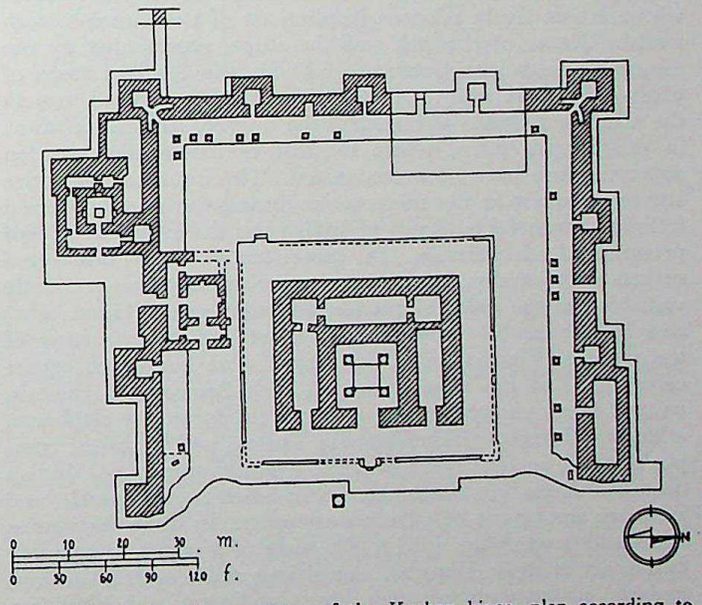
Urban centers. The vast Kushan empire was administered from large capital cities. In the northern part Begram (anc. Kapisi) was the summer capital and Peshawar the winter residency; in the south Mathura served as the royal seat. Ruins of Kushan cities are preserved at Udegram and Begram as the upper layers of older towns, and at Sirsukh (Taxila) as fresh foundations.

Everywhere can be seen the combination of the type of Central Asian nomadic camp with various forms of Mediterranean town planning. In the last period of Begram I the rulers of the first Kushan dynasty adapted their cities to the character of a regularly planned town with walls like those of the Hellenized Greco-Bactrian kings.

The second Kushan dynasty of Begram II continued to use the town, enlarging the stone houses with mud-brick constructions and introducing a new technique of stone socles serving as bases for pisé walls. In the mud-brick houses of Begram III of the third and fourth dynasties there appear innovations of banquettes and niches such as are known in contemporary south Russian and Chorasmian dwelling houses (see KHWARIZM). Other striking affinities with Transoxianian types of architecture are to be seen in the square structure with four bastions in the form of a three-quarter circle, a fortress within a fortified town. At the same time walls with semicircular bastions and corner buttresses are the dominating feature of the stone structures of Sirsukh (Taxila). In the form of a parallelogram, the Kushan city lies in an open plain protected by a small river near the eastern part of the south wall. An original Central Asian system seems to be combined with methods of the Roman castrum.

Mathura of the Kushans was protected to the north by the broad Jamuna River. Depending on the geographical situation, an earthen wall and a mud-brick fortification surrounded the city area. In the western part of this fortified city a mud-brick fortress with corner bastions was situated at the crossing point of two main streets. The plan of this city has influenced all later stages of Mathura. Accordingly we might find in present Central Asian cities or ruined sites such as Airtam (near Termez), Afrasiyab, Tali Barzu, and Toprak Kale the remains of a city system introduced by the Kushans.

No superstructures are preserved from the Kushan period. Architectural representations on narrative reliefs from Gandhara



Surkh Kotal, dynastic sanctuary of the Kushan kings, plan according to the excavations of 1953 (*from D. Schlumberger*).

and Mathura give an idea of city walls with pavilions, towers, and streets between two-storied houses with wooden balconies. At present it is uncertain whether there really existed vaulted rooms with coffered ceilings, as depicted in some reliefs.

Dynastic sanctuaries. Three ruins and find sites — in the south Russian steppes, on the northern slope of the Hindu Kush, and in the Jamuna-Ganges plain — represent a special kind of dynastic and cult monument and, in spite of many local variations, all belong in the area of Greco-Iranian art. In the Kushan stratum of Toprak Kale the royal palace (PL. 389) and fire temple are the spiritual centers of the town; the Kushan style — best known in Gandharan and Mathuran stone sculpture — is evident in wall paintings of the post-Kushan palaces glorifying the ruling dynasty and in stuccoes and colorful figural representations.

The acropolis on the hill of Surkh Kotal (FIG. 1046), accessible by a flight of well-dressed limestone stairs, is crowned by a fortress with square towers and a great peribolos. The Attic bases of the four columns of the fire altar are preserved (II,

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

PL. 86). From three male statues in Scythian dress and the great inscription on the outer wall of the structure, it appears that Kaniṣka I himself represented the deity worshiped in this sanctuary. The fragment of a male head excavated in 1953 at Surkh Kotal is of value for the study of individual expression in Greco-Iranian art.

A monumental figure from Mathura, of the same Scythian style, is named by an inscription as Kaniṣka (PL. 1). This rare work of art belonged, together with other sculptures, to the sanctuary at Mat, near Mathura, which was probably a kind of portrait gallery for worship of the ancestors of the dynasty.

SCULPTURE AND RELIGIOUS MONUMENTS. Architectural fragments of pseudoclassic Attic bases, Corinthian capitals, and stone decoration with vine leaves, stepped pinnacles, and rows of beading or rosettes derive from cult buildings, mainly Buddhist. Remains of this Greco-Iranian style [known also in Parthian buildings of Palmyra and Nysa (Nisa)] stretch from Toprak Kale to Termez, Balkh, Kunduz, Surkh Kotal, Shotorak, Hadda, Jandial (Taxila), Jhelum, and Mathura. Within this huge area are distinguished several regional varieties.

The fragments of capitals from Airtam, the plan of the Buddhist monastery and of the underground chambers of Kara Tappa, and the remains of wall paintings in the Bamian style are examples of the Kushan art that was dominant in several religious communities in Khwarizm, Uzbekistan, and Sogdiana for some centuries after the Kushan rule had ceased.

Bactria and Gandhara were the main Buddhist countries whose artists freely adopted inspirations of the Greco-Roman world. Center of the cult was the stupa, represented by the gigantic mud-brick structures of Balkh, the Kaniṣka stupa of Shah-ji-ki-Dheri near Peshawar (about whose gilded towers the Chinese pilgrims wrote), and the unique, large stone stupa in the Ghazni plain, where remains of the ancient wooden superstructure have been recognized. The innumerable votive stupas of schist in the monasteries during the Kushan period followed a general tendency of Indian art: the evolution toward pronounced slenderness. In some stupas were discovered caskets with jewelry, inscriptions, and Kushan coins; especially valuable are the gold reliquaries from Bimaran (VII, PL. 465) and Peshawar. The freestanding stupa was at the center of the monastery courtyard. (The monks were housed in square cells.) The stupas were decorated with Persepolitan capitals, winged lions, chaitya arches, columns supported by elephants, atlantes, Tritons, garland-bearing Erotes, and fantastic compositions of ancient Near Eastern, Mediterranean, and Indian origin. Those of Shotorak, Takht-i-Bahi, Jamalgarhi, and Sikri are among the best-known examples. In these sanctuaries the Buddha was worshiped in the form of a seated or standing cult image in stone or stucco. Auspicious marks such as the *ūrṇā* and the *uṣṇīṣa* were conceived by Gandharan and Mathuran artists according to the Buddhist holy scriptures (see BUDDHISM). In well-balanced artistic contrast to the serene face of the Buddha, the Indian sculptors represented the surrounding figures — men, women, and demons — with individual and even ethnographic characteristics.

The stuccoes from Kunduz (II, PL. 88), Hadda (VI, PL. 20), and Taxila in particular display a beautiful combination of the Asian with the Mediterranean mind. Friezes around the stupas illustrated continuous legendary scenes from the Jatākas and the Buddha's life, the traditional Indian style enriched by Greco-Roman imagery; but the Greco-Roman elements are constantly set off by anticlassic Oriental forms of linearity and rigidity. Three-quarter relief fills the friezes, and empty space is rarely left. The scenes are often symmetrically grouped, and the action takes place mainly in the foreground; background figures appear on a higher level. Scanty details suggest the locality. Figures and groups are rendered frontally, and, according to the rules of hieratic art, usually the main figures — the bodhisattva or the Buddha — are larger than the other figures.

Architecture and sculpture also display local variations in Bactria, southern Afghanistan, the Kunar Valley, Swat, and the environs of Peshawar and Taxila. Unique monuments are the monolithic stupa at Haibak (see AFGHANISTAN); the "platform of statues" in the plain beneath Surkh Kotal, with the remains of a more than life-size earthen figure; the row of votive stupas added to the city gate site of Begram III; and the towers Minār-i-Cakri and Surkh Minār, in schist diaper work, on mountain peaks near Kabul, in the vicinity of the Logar Valley stupas. The towers probably displayed the Buddhist symbol of the Wheel of the Law. In addition, the cave monasteries and colossal rock-cut figures of the Buddha (ca. 115 ft. and ca. 175 ft. high) in the Bamian valley (see INDO-IRANIAN ART; PL. 10) show Central Asian, Iranian, Indian, and Mediterranean features side by side in architecture, sculpture, and painting. Traces of Buddhist painting in the Kushan style, enriched by motifs from Sassanian and Gupta art (qq.v.), also survive in the Foladi and Kakrak valleys near Bamian (PL. 12) and in the buildings at Hadda.

Kaniṣka I and Huviṣka extended their rule over Kashmir (see KASHMIR ART). The Buddhist site of Harwan dates from Kaniṣka's reign; its apsidal temple in diaper pebble style is surrounded by a tiled courtyard with patterns that reveal Chinese, north Indian, Near Eastern, and Mediterranean influences (PL. 359). The name of Huviṣka is preserved in the name of the sanctuary at Ushkur (Huvishkapura), where beautiful terracotta heads were produced in late Kushan style up to the middle of the 1st millennium of our era (see INDIAN ART).

At Mathura the Buddhists and the Jains built stupas surrounded by stone railings like those at Bharhut and Sanchi. The Kushan style is obvious in the decoration — Near Eastern and Mediterranean palmettes, animal friezes, and astragals — intermingled with Indian toranas (Skr., *toraṇa*) and arches. Legendary scenes from the life of the Buddha are rendered in an abstraction of the Gandharan relief style. Female figures decorating the railings of Bhuteshar (VII, PL. 450; IX, PLS 381–383) and Kaṅkālī Tīlā are of purely Indian origin in their sensuality and expressiveness. The same Indian style was also used for one subject of the classical world: Hercules strangling the Nemean lion. A female figure perhaps representing Hāriti, however, shows the adaptation of the typical Gandharan style to a monumental sculpture of a type unknown in Gandhara itself. Various Eastern and Western patterns decorate the *āyāgapaṭṭa*s (votive tablets) of the Jains (PL. 258). Illustrative reliefs found in various places near Mathura, the Kumrahar plaque, and replicas of the Vajrāsana (or Mahābodhi) temple at Bodhgaya (VII, PL. 133) indicate that priests and architects of Mathura created, during the Kushan period, the first form of a towerlike structure as the upper finial of a sanctuary. This innovation thenceforth marked the evolution of the Indian temple. Possibly the Hindus of Mathura worshiped their cult images in such structures.

Artists of the Kushan period originated both the forms and the iconography of anthropomorphic representation of the Hindu gods that were passed on to Gupta, medieval, and even modern times as elements of Indian art. The expressive, hieratic, frontal figure of the traditional Indian yaksha in high relief became the model for images of Sūrya, Śiva, Brahmā, and Viṣṇu.

JEWELRY. Various finds of jewelry from Khwarizm and Taxila are comparable to the treasures of the Kushan city of Begram II. The wealthy population favored gold ornaments enriched with polychrome stones among which red stones — probably rubies from Badakhshan — predominated. This art belongs to the style of the steppe nomads and is known in Sarmatian jewelry from the ancient home of the Kushan tribes. Small gold disks have been found in excavations of Kushan sites; such pieces are also represented as decoration of the Scythian riding costumes on statues from Surkh Kotal and Mathura.

POTTERY AND FIGURINES. Small clay figurines have been discovered in Kushan layers, notably at Begram, Balkh, Airtam, Dzhanbas Kale, and Koy-krylgan Kale. These figurines reflect two artistic inspirations. In the beginning of the Kushan period Western models can clearly be recognized by the at-

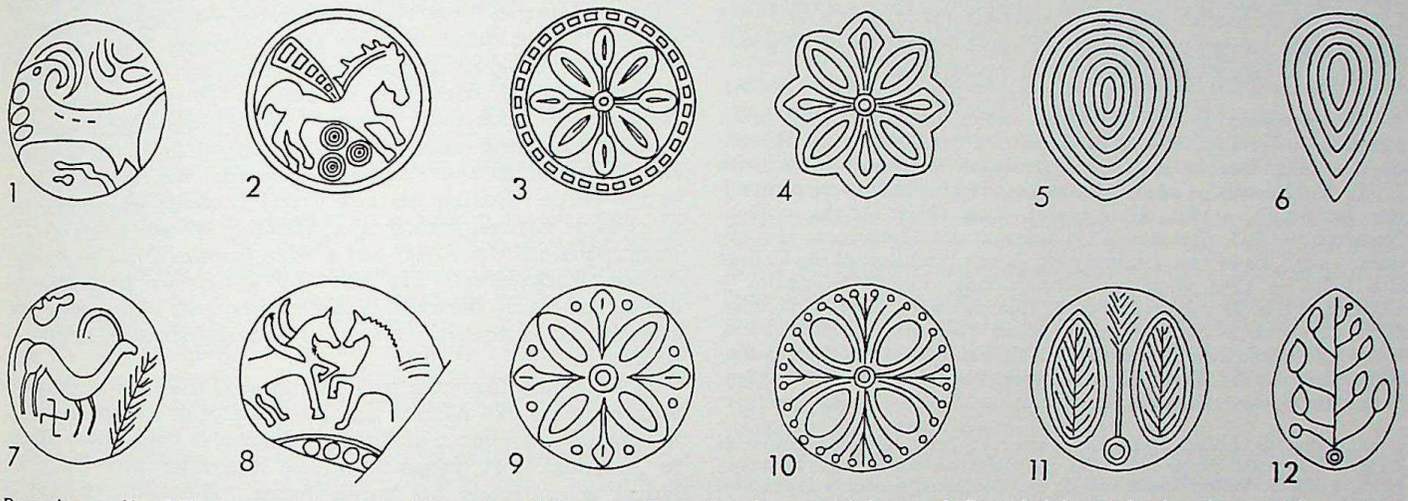
CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

titude, proportions, costume, and facial expressions of the figures. Later on, purely Indian influence appeared in the sensual, yakshi-like female figures with heavy ornaments and in male figures that display the Scythian equestrian costume known from the royal statues of Surkh Kotal and Mathura and from the coin images (PL. 409).

Simple utensils of daily life, such as the various forms of pottery, derived totally from local workshops and do not reveal any foreign influence. Detailed classifications of jars, bowls, cups, and dishes are based on the Begram (FIG. 1049) material, but types from Rang Mahal, Balkh, Shamshir Ghar, Airtam, Ayaz Kale, and Gyaur Kale can generally be fitted into the same categories.

Gray-black ware was no longer produced after the early Kushan period, but a fine, thin red pottery was made occasion-



Decorative motifs of Kushan ceramics from Shotorak and Begram. Shotorak: (1) goat; (2) horse of Central Asian style; (3, 4) geometric rosettes; (5, 6) meander designs. Begram: (7) goat; (8) winged affronted horses; (9, 10) geometric rosettes; (11, 12) plant motifs (*drawings from the Delégation archéologique française en Afghanistan*).

ally. The greater part of pottery during the first two dynasties was a coarse red ware of poor quality. Decoration consists of incised circles, wavy lines, and fishbone patterns; relief ornaments on the shoulders or handles of the vessels are rare. In Begram III a new type appeared: a stamped ware of the traditional form, decorated with rich geometrical, floral, and animal patterns, in which sometimes old Iranian heraldic motifs seem to survive. During this period Shamshir Ghar supplied a metallic black pottery which, like other ceramics too, may have been produced after a model in metal. Some rare glazed and painted shards also occur.

LABROUSTE, HENRI. French architect and professor of architecture (b. Paris, May 11, 1801; d. Fontainebleau, June 24, 1875). In 1819 Labrouste entered the Ecole des Beaux-Arts in Paris, where he was a pupil first of A. L. T. Vaudoyer and then of L. H. Lebas. In 1824 he won the Prix de Rome and spent five years (1825–30) in Rome, where he produced a controversial restoration of the temples at Paestum (1828–29). Labrouste's conclusions concerning the Greek use of polychromy gained him a certain notoriety in Paris, and upon his return in 1830 he opened an atelier at the Ecole. Although he was dissatisfied with the Ecole and had earned a considerable rep-

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

utation as a rationalist, Labrouste neither crusaded for changes nor published his views. Appointed inspector of works for the new buildings of the Ecole itself (1832, under Jacques-Félix Duban), he was soon named architect of the Bibliothèque Ste-Geneviève (1838), and constructed its new quarters (1843–50). While the interior is admired for the bold and sensitive use of cast iron in its frame, the masonry exterior is also of great merit, recalling certain aspects of contemporary German architecture and the revolutionary classicism of J. N. L. Durand.

Named architect of the Bibliothèque Nationale in 1854, Labrouste subsequently constructed its cast-iron domed reading room (1861–69) and stacks (1862–67), works which show his continuing desire to reconcile the new material with traditional modes of design. In this, as in his failure to expound his doctrines emphatically, Labrouste appears as a typical revolutionary *manqué* of the mid-19th century. His election to the Institut de France at the age of sixty-six (1867) was a tardy yet appropriate recognition of his accomplishments as an academic designer of uncommon ability and penetration.

LACE. See TEXTILES, EMBROIDERY, AND LACE.

LACHAISE, GASTON. Sculptor (b. Paris, Mar. 19, 1882; d. New York, Oct. 19, 1935), son of an Auvergnat cabinetmaker. He received his early training at the Ecole Bernard Palissy, and later attended the Ecole des Beaux-Arts. In 1904 he left school to work with René Lalique. He met his future wife, Isabel Nagle, in 1905, and followed her to America, arriving in Boston, January, 1906. There he worked as an assistant to Henry Hudson Kitson, an academic sculptor, whom he followed in 1912 to New York, where he began his first large nude figure, *Standing Woman*. His wife posed for this figure, as she did for many others. Although she was a large woman, the amplification of the form came from his imagination, conditioned by the Art Nouveau style of Lalique.

Lachaise worked for a time as an assistant to Paul Manship, but his ideas for his own creative forms departed sharply from the academic norm. He began a series of statuettes, the earliest of which show the influence of Rodin in their rough surfaces and dynamic poses. Others reveal the emphasis upon large breasts and hips which was to prevail in much of his later work. In 1913 he began carving in stone *La Montagne* (Worcester, Mass., Art Mus.), a reclining woman of truly mountainous proportions (the stone figurine and several later bronzes of it are small; a later version in concrete is 9 ft. long).

One of Lachaise's exaggerated figures was included in the Armory Show (1913). The Bourgeois Galleries offered him his first one-man exhibit in 1918. His work was praised by critic Henry McBride and two of his pieces were sold, but the large *Standing Woman* (68 in. high, in plaster) was ridiculed by conservative critics. In 1920 he held a second show at the Bourgeois Galleries, but sold nothing.

The art dealer, C. W. Kraushaar, began to buy his work regularly. James Sibley Watson and Scofield Thayer, editors of *The Dial*, publicized his sculpture and sat for portraits. He also did portraits of Marianne Moore, E. E. Cummings, Gilbert Seldes, Edgar Varèse, and Henry McBride.

His decorative work continued to be his main source of income. Alfred Stieglitz gave him a one-man show in 1927 which established him firmly as one of the avant-garde. The head of John Marin (New York, Mus. of Mod. Art), one of his best-known portraits of this period, was modeled in a craggy impressionistic manner, unlike the smoothly rounded forms of his female heads. In the following year, the art dealer Joseph Brummer arranged an impressive exhibition including his stylized drawings. In addition to a bronze of the *Standing Woman* (one is owned by the Whitney Mus., New York), the exhibit included a large plaster figure entitled *Floating Woman* (a bronze of the latter is today in the Mus. of Mod. Art, New York; I, PL. 130).

Lachaise was commissioned in 1931 to do a frieze on the RCA building in New York's Rockefeller Center, and, in 1932, a portal (since destroyed) for the Electricity Building of the Century of Progress Exposition in Chicago. He later did two large reliefs of construction workers for the International Building of Rockefeller Center. The monumental plan for his first sculptural commission at Fairmount Park, Philadelphia, the *Memorial to the Peoples of America*, was left unfinished at his death. During his last years, Lachaise executed a few more large figures, including a *Standing Woman* (bronze, New York, Mus. of Mod. Art) and a *Man* (bronze, New York, Coll. Nelson Rockefeller). He also did a number of half-length nudes, full-figure portraits of his friends, and some remarkable semiabstract compositions based on acrobats, dancers, and female torsos.

Developing from the modern classical tradition of the early 20th century, like Maillol and Despiau, and, like them, under the pervasive influence of Rodin, Lachaise, although transplanted to American soil, forged a strong individual style based on lyrical accentuation of female forms, while still clinging to the European tradition of the contemporaries he admired: Lehmbruck, Epstein, and Brancusi. Working in New York after the Armory Show, he became a pioneer in modern American sculpture, a position shared in those years only with William Zorach and Robert Laurent.

Henry R. HOPE

LACQUER. The use of lacquer as an art medium originated in China, whence it spread to other Oriental countries, Japan, Korea, Iran, and the Islamic world. A form of lacquer work was also produced in Europe. Although the origins of this medium are obscure, they must be found within the zone where the lac tree, *Rhus vernicifera*, is indigenous, for its sap is the prime component of lacquer. This zone is believed to have been more extended than it is now, including in the past certain areas of northern and western China. Used chiefly for the beautification of utilitarian objects, lacquer is characterized by the hardness and unalterability which it confers on even such impermanent materials as vegetable fiber, textiles, and paper. These special qualities have given rise to numerous individual techniques for its use. Esthetically, the use of lacquer is a manifestation of a taste for varied and brilliant colors and for glossy surfaces. It is from these qualities, and their almost universal appeal, that the art of the lacquerer derives its importance and wide diffusion.

SUMMARY. China (col. 1052). Korea (col. 1056). Japan (col. 1056): *Historical and stylistic development; Techniques*. Iran and the Islamic world (col. 1061). The West (col. 1061).

CHINA. In the preparation of Chinese, Korean, and Japanese lacquer, the sap of the *Rhus vernicifera* (Chin., *ch'i shu*) is strained, slowly heated to remove impurities and excess moisture, and stored in airtight vessels until it is ready for use. Lacquer,

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

being very resistant to water, heat, and acids, constitutes an excellent protective covering, especially for wooden objects. Moreover, its glossy surface is eminently suited to decorative uses. The majority of lacquered objects are made of wood, but lacquer can also be applied to bronze, iron, pottery, porcelain, leather, basketwork, and even to cloth. In pre-Han times, black lacquer was used as a writing material. From the earliest times, lacquer was applied with a brush either directly on the surface of the article or over a priming or undercoat which often included a piece of cloth. In the dry-lacquer technique (*chia chu*), a piece of cloth saturated with lacquer was spread over a form or model of the article. After the lacquer had dried and stiffened, the form was removed and further lacquer coatings were applied. Lacquer dries best in darkness and in warm and humid air. Black and red are the colors most frequently found, black being derived probably from iron sulphate, and red from cinnabar; brown, green, yellow, blue, gold, and silver lacquers are also found. For decorative purposes, lacquer could be painted, carved in relief, engraved, inlaid with gold, silver, mother-of-pearl, and other materials, and used in combinations of various colors. Relief and marbled effects were achieved by molding the priming. (The various techniques of decoration are described in greater detail in the section on Japanese lacquers.)

Although there is a tradition to the effect that lacquer was first used during the reign of the legendary emperor Shun, no definite data are available earlier than the Warring States period (480–221 B.C.). It is possible that the black inlay found on some Shang (1523–1028 B.C.) bronzes is lacquer, but this has not been established with any certainty. Most of the late Eastern Chou lacquered objects known today were found in tombs near Ch'ang-sha (Hunan), which at that period was an important city in the state of Ch'u. Others came from Kuwei-ts'un, Hui-hsien, and from Chin-ts'un (all in Honan). Some large lacquered wooden guardian figures from a tomb at Hsin-yang in southern Honan have been discovered in China. These finds include boxes, bowls, plates, sword scabbards, shields, coffins, pottery vessels, wood sculptures, and bronze fittings. The provenance of the lacquers is, however, unknown. Reports as to the sites often appear to be reliable, but only a few pieces have been excavated under archaeological supervision. Lacquers with wooden bodies usually have been found in a waterlogged condition, since the tombs had often been flooded and water had penetrated through cracks or other flaws in the lacquer coating. Evaporation of the water after excavation often causes the wood of such pieces to shrink, and the lacquer is consequently damaged beyond repair. A large number of lacquered objects appear to have been lost in this way.

The decoration is usually painted. Occasionally the wood was first carved in relief and then lacquered; such pieces may also carry additional painted decoration. One plaque, presumed to have decorated a sword pommel, appears to be carved lacquer. The repertory of decorative motifs consists largely of a combination of more or less stylized animals, especially birds, and geometrical patterns of lines and forms. Frequently animals or parts of animals are reduced to unrecognizable shapes; sometimes as many as four stages of animal stylization occur on a single piece. The style of the decoration is related to that of mirrors and gold- and silver-inlaid bronzes.

Chinese records mention three state factories which produced lacquers during the Han dynasty (206 B.C.–A.D. 221). One was in the Ho-nei district in northern Honan; the other two were in the Shu and Kuang-han districts in Szechwan. Many private factories must also have existed. Some vessels carry inscriptions giving the size, place and date of manufacture, the names of the artisans, and those of the manager of the factory, his assistant, the clerk, and the officer of the guard. Inscribed specimens from the Shu and Kuang-han factories have also come to light. These inscriptions indicate a highly developed division of labor, with as many as six artisans engaged in the manufacture of a single piece. The inscriptions are found either on plain specimens or on those which have relatively simple decorations, usually of birds and scrolls. The most richly decorated lacquers are not inscribed; they may therefore have been privately produced. The finest pieces made by the state factories were probably reserved for the imperial court. Most of the known specimens have been excavated by Japanese archaeologists from tombs near Lo-lang in northern Korea (PL. 413). During the Han period, Lo-lang was a Chinese colony; the majority of the lacquers found there appear to date from the 1st and 2d centuries. Other pieces have been excavated in Yang-kao-hsien (Shansi), in Noin-ula (northern Mongolia), and even as far west as Begram in Afghanistan. As there is no clear-cut dividing line between late Eastern Chou and Han lacquers, it is often difficult to give definite attributions to the artifacts of these two periods. Some of the pieces found at Ch'ang-sha may, however, be attributed to the Han period on stylistic grounds. No guardian figures or other fantastic sculptures of the Han period have been found, but, in general, lacquer was put to the same uses in both periods. The finds include crossbows, tables, and table tops.

Painting was still the favorite decorative technique in the Han period (PL. 415); engraving, however, was also used, sometimes in combination with painting. Silver and gold were used as inlays, but very few pieces of such work have been found. The "cloud-scroll" ornament dominates the repertory of decorative motifs; frequently interspersed with animals, the cloud scrolls probably symbolize Taoist mountain landscapes (see TAOISM). Dragons began to assume the shape which they were to maintain for centuries with only slight variations. Geometric ornamentation was generally confined to narrow borders. A few specimens have figured decoration. The most famous of these, the "Painted Basket" (PL. 413) found in a Lo-lang tomb, also shows a floral tendril as a border ornament; it is one of the earliest known examples of formalized floral decoration and probably dates from the 2d century.

Almost nothing is known of the lacquers produced between the Han and T'ang periods. Excavations in Korea have yielded a lacquered mask and some fragments. A few bronze mirrors in which elaborate figural decoration cut from a thin sheet of gold is laid into a lacquer background may be attributed to this interim period.

Our knowledge of T'ang (618–906) lacquer work is based almost entirely on the numerous pieces preserved in the Shōsōin in Nara, Japan, where among the lacquered objects are boxes, sword scabbards, musical instruments (PL. 414), mirrors, iron stirrups, and a ewer. Gold and silver foil inlay (Chin., *p'ing t'o*; Jap., *heidatsu*) was the favorite decorative technique; mother-of-pearl, tortoise shell, and other materials were also used as inlays. Painted specimens occur less frequently. The Shōsōin does not seem to have contained any carved or engraved lacquers, but this collection probably represented the taste of the 8th-century Japanese court. T'ang decorative art was strongly influenced by Persia and by India, and the style of lacquer decoration is closely related to that of silver vessels, undoubtedly because of the wide use of silver inlay. Occasionally, however, the design of *p'ing t'o* pieces seems to have been derived from silks.

Apart from the objects preserved in the Shōsōin, a few Buddhist sculptures made by the dry-lacquer technique may be tentatively attributed to the T'ang period for reasons of style.

Very little is known about Sung (960–1279) lacquers. The few pieces attributed to that period are believed to have been found in Chü-lu-hsien, a city in southern Hopei destroyed by flood in 1108. These include dishes, bowls, and boxes lacquered in black, brown, or red and entirely devoid of decoration. Most of them are made in the dry-lacquer technique in shapes resembling the contemporaneous ceramics. The same technique was used for Buddhist sculptures; these, however, are very rare. Chinese records of the 16th century describe beautiful lacquers carved down to a background of gold or silver (lacquer?), but none appear to have survived.

The same 16th-century records mention two famous lacquer artists, Chang Ch'êng and Yang Mao, who lived at the end of the Yüan dynasty (1260–1368). Specimens bearing the incised mark of both these artists exist but are of doubtful authenticity. Chinese archaeologists have discovered a carved lacquer

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

box with figural and landscape decoration in a 14th-century tomb. This is the only piece which can be definitely attributed to the Yüan period.

Our knowledge of Ming (1368–1644) lacquer is based on a series of pieces with reliable reign marks. Specimens exist which bear the marks of the emperors Yung-lo (1403–24), Hsüan-tê (1426–35; PL. 420), Hung-chih (1488–1505), Chia-ching (1522–66), Lung-ch'ing (1567–72), Wan-li (1573–1619), and Ch'ung-chêng (1628–43). Most of these marked pieces were produced in the imperial factories. The Yung-lo marks were incised with a needle and may be apocryphal; they are usually found on early-15th-century specimens. With the reign of Hsüan-tê the marks on imperial pieces began to be cut with a knife and filled with gold lacquer. The reign of Hung-chih is represented by a single specimen, a finely carved plate dated 1489 in the Percival David Collection, London; it was undoubtedly privately produced. Only two pieces with Lung-ch'ing marks are known; both are imperial products. There are no reliably dated pieces from the important reigns of Ch'êng-hua (1465–87) and Chêng-tê (1506–21) nor any undated specimens which might be attributed to either reign; it has not yet been possible to explain these gaps. Wan-li pieces, often with cyclical marks giving the exact year of manufacture, comprise boxes, plates, dishes, bowls, cups, cupstands, chalices, vases, jars, ewers (which are very rare), tables, chairs, footstools, cabinets, and chests.

Carving was a favorite technique, particularly in the imperial workshops. The pieces are usually cinnabar red, but such colors as buff, black, green, and yellow appear also. Another technique used by the imperial workshops is one similar to the Japanese *zonsei*. Painted, inlaid, carved, and marbled pieces were produced mainly by private artisans. Mother-of-pearl, metal, bone, and hard stones were used as inlays.

In the first half of the 15th century, the best pieces were produced by the imperial factories. Production, however, seems to have been small and specimens of that period are quite rare. Although private workshops certainly existed at that time, it has not been possible to identify any of their products. The decoration of the early-15th-century imperial pieces is boldly conceived and beautifully executed. These works can be classified into three groups, according to the principal decorative motifs: flowers and foliage; figural and landscape scenes; dragons or phoenixes (or both) in conjunction with flowers or clouds (PL. 416). Borders and other small surfaces usually carry floral decoration. The design of the carved specimens in the first and third groups is arranged in a close-knit manner, showing very little of the generally smooth, yellow background. Obviously this style could not be used for the second group, where specific, finely carved background patterns indicate earth, water, and air. The carving is sensitively modeled and the edges of individual details are slightly rounded. Such pieces give the impression of having been modeled in wax. These "zonsei" examples are extremely rare. They are always polychrome, although sometimes details of the design are outlined in gold lacquer.

During the 16th century production seems to have increased. In addition to many imperial Chia-ching and Wan-li pieces, a large number of other lacquers can be attributed to the 16th century, usually on stylistic grounds. Some of them are also dated and are apparently products of private artisans. The style of the decoration is less bold; individual details such as flowers, leaves, and figures are smaller in relation to the decorated surface. The repertory of decorative motifs was enlarged; characters and symbols of longevity, happiness, and other felicitations occur frequently. It is no longer possible to classify the imperial pieces, as numerous decorative motifs are frequently found on a single piece. Dragons, rarely used in the early 15th century, occur very frequently on 16th-century examples. Carved specimens often have sharp edges and abrupt transitions from one level of relief to the next. Such pieces give the impression of wood carvings; this is particularly true of imperial Chia-ching products.

Very little is known about lacquers of the early Ch'ing period. Imperial specimens with either K'ang-hsi (1662–1722) or Yung-chêng (1723–35) marks do not seem to exist. The so-called "Coromandel" lacquers were apparently an innovation of the K'ang-hsi period; several large Coromandel screens carry K'ang-hsi dates. The Nationalmuseet in Copenhagen owns some provincial pieces which are known to have reached Denmark during the second half of the 17th century. There are also a few other provincial pieces with painted decoration marked either K'ang-hsi or Yung-chêng. The emperor Ch'ien-lung (1736–95) had a preference for carved lacquers and much was produced during his reign, including the usual boxes, plates, and bowls, as well as thrones, screens, and other furniture. Large panels (sometimes depicting battle scenes), figurines, small chests on wheels, and toy horses with carts are characteristic of the period. The best 18th-century pieces are masterworks of craftsmanship. The designs, however, are usually too crowded, the details too small for real artistic quality. Private artisans favored the *burgautée* technique of a very fine mother-of-pearl inlay.

Occasionally during the 19th century simple vessels, either with or without discreetly engraved decoration, were made for Chinese connoisseurs. Various articles, usually lacquered black with painted gold decoration, were made for export to Europe and America. Carved pieces are generally coarse.

KOREA. Korean lacquer has never been adequately studied. On the basis of present knowledge, it is often difficult or impossible to differentiate between Chinese and Korean pieces. Korean lacquer artisans seem to have specialized in mother-of-pearl inlay. This was first commented upon in 1123 by the Chinese ambassador Hsü Ching, who wrote that Koreans "are not very good at lacquer work, but their [lacquer work with] inlaid mother-of-pearl, which is minutely executed, should be valued." A few boxes decorated in that technique were excavated in Korea; several others are in Japanese and Western collections. Some of them were made to contain Sūtras (sacred Buddhist texts). One of these boxes is decorated with a landscape; the others show tight floral scrolls with petals and leaves of mother-of-pearl and stems inlaid with twisted wire. Colored tortoise shell was occasionally used for certain details. The style of decoration is related to that of the celadons with slip decoration of black, white, and sometimes red. These lacquers date from the 12th–14th centuries and are the only pieces for which a Korean origin is reasonably certain.

Lacquers were also produced in Burma, but almost nothing is known about them. The few boxes and bowls in Western collections do not seem to antedate the 18th century.

Fritz LOW-BEER

JAPAN. *Historical and stylistic development.* Even though concrete evidence is lacking, it can be assumed that Japanese lacquerers learned their craft from the Chinese during the early centuries of the Christian Era. There is, however, a semilegendary tradition which tells of a 2d-century prince named Yamatotakeru who broke a branch off a certain tree and noticed that the sap in his hand turned a lustrous black. He thereupon ordered his vassal Tokoba-no-Sikune to paint utensils with this juice. The story might indicate that the lac tree grew in Japan during the archaic period, which lasted until the mid-6th century. A few specimens from this period have been excavated in the northern part of Japan.

The first historical record of Japanese lacquer is an edict of the year 645 establishing the Imperial Lacquer Works. In 701, in the full flowering of the Nara period (645–793), the works employed 30 workmen. From the same year is an edict which encouraged the growing of lac trees by granting lands for this purpose in exchange for an annual tribute of the sap. The oldest existing example of lacquer work of any artistic value is a splendid miniature Buddhist temple known as the Tamamushi Zushi in Hōryūji, Nara (PL. 418). This shrine, over 7 ft. high, is built of wood finished with black lacquer and ornamented with gilt metal and iridescent beetle (*tamamushi*) wings. The painted lacquer decoration represents Buddhist deities and scenes from previous incarnations of the Buddha; one of the four panels of the base shows the Buddha

1057

sacrificing his body to feed a hungry tiger. These decorations are executed with remarkable dexterity in red, yellow, and green — a color scheme reminiscent of Chinese lacquer of the Han dynasty. The Tamamushi Zushi is attributed to Korean artists active in Japan about 646–708 (see JAPANESE ART).

The most specifically Japanese lacquer is *maki-e* (see the discussion of the various techniques below). The earliest type of *maki-e* is known as *makkinru*. An example is the decoration of a sword scabbard belonging to the emperor Shōmu (d. 756), now in the Shōsōin at Nara. The design, consisting of animals flying among clouds, is carried out in gold filings processed by the *togidashi* (revealed-by-grinding) method. Two other types of lacquer work, *heidatsu* (using gold and silver foil) and *raden* (with mother-of-pearl) are found in the Shōsōin. These represent two important steps in the development of *maki-e*. It is not yet known whether the *makkinru* technique originated in Japan; *heidatsu* and *raden* are found in Chinese lacquer objects of the T'ang dynasty, but so far no examples of *makkinru* have been discovered outside Japan. During the latter part of the Nara period images made by the *kanshitsu* (dry-lacquer) process were very popular. This process, however, belongs more properly in the realm of sculpture, since the lacquer is used only as a binder.

The Fujiwara or late Heian period (895–1185) is marked by a steady progress in *maki-e*, the term appearing in Japanese literature in the mid-9th century. The luxury-loving nobility demanded more and more gold lacquer, taking advantage of the increasing output of the gold mines. The lacquerers' art thus was applied not only to movable articles but also to the interior decoration of large buildings.

In the first half of the period, the only technique used appears to have been the *togidashi*, as attested by several extant pieces. Typical of this technique is a box ordered by the Emperor in 919 to hold the manuscripts on an esoteric form of Buddhism brought to Japan by Kūkai (Kōbō Daishi). The design is composed of *karyo-binga* (mythical birds) surrounded by sacred flowers and clouds, executed in gold and silver filings (PL. 417). The decorative motifs on this box reflect T'ang influences. This Chinese influence was, however, soon replaced by a more pictorial Japanese style.

By the middle of the period, the *chiriji* and *ikakeji* techniques, employing gold-dust grounds were developed. This indicates an abundant supply of gold as well as improvement in the techniques for smoothing and sifting the metal particles. Mother-of-pearl inlays were also used to embellish the otherwise simple *chiriji* and *ikakeji* grounds. One of the most extravagant decorations in this gold-lacquer and mother-of-pearl technique is found in the interior of the Konjikidō in Hiraizumi, built in 1124. Although this temple has suffered greatly from the ravages of time, enough of the decoration remains to attest its original splendor.

The flat gold *hira-maki-e*, the simplest of all gold-lacquer techniques, was developed not earlier than the second half of the 12th century. It was probably made possible by the production of a very fine type of gold powder. The oldest existing specimens of *hira-maki-e* are the drawings of Buddhist groups, in gold and red, on a number of boxes made in 1176 for the storage of sutras.

It is interesting to note that Chinese historical records of the Sung dynasty state that in the year 987 the Chinese court received as a gift lacquer objects of many kinds, decorated with gold, silver, and mother-of-pearl. This would indicate that these specimens of Japanese lacquer were considered characteristic of the arts of Japan and worthy of presentation to the Chinese emperors.

During the Kamakura period (1185–1333) the raised-gold *taka-maki-e* was developed. This enabled lacquerers to follow the general trend toward the freer, more pictorial decoration that characterizes this period. A notable example of *taka-maki-e* is the early-13th-century box for toilet articles believed to have belonged to Lady Taira-no-Masako (1156–1224; PL. 419). Here the birds and trees are slightly raised by means of double layers of lacquer under the gold. The waves, rocks, and land are in *hira-maki-e*, while the Chinese characters and the single-petaled flowers are in silver foil — all on a gold ground. This box not only represents the first attempt to use the raised-gold technique, but it is also an early example of the use of patterned metal foils, applied in combination with different lacquering techniques. Although *tsuishu* (carved red lacquer) was imported to Japan from China during the Kamakura period, no attempt seems to have been made by the Japanese lacquerers to adopt the technique until a later period. Even the Kamakura *bori* (lacquered, carved wood), which may have originated in the Kamakura period, does not seem to have been in general use until later.

During the Muromachi (Ashikaga) period (1334–1573) the *taka-maki-e* technique was further developed. Greater thickness was obtained by the use of a mixture of powdered ocher and lacquer. An early specimen of this technique is the set of boxes (PL. 420) presented to the Kumano-Hayatama Jinja shrine at Wakayama by the shogun Ashikaga Yoshimitsu in 1390. These boxes have a raised design finished in gold and silver dust and foils; some also have mother-of-pearl and carved metal. Minute pieces of gold or silver foil known as *kirikane* (cut metal-foil decoration) are used in the rocks which form part of the design. These boxes have the two kinds of gold-particle-strewn grounds, *hirame* (literally "flat eyes") and *nashiji* (literally "pear-skin" or aventurine ground). Both forms were developed from the older *chiriji* technique. During the second half of the Muromachi period, under the shogun Ashikaga Yoshimasa (1435–90), two families of *maki-e* artists, Kōami and Igarashi, were active under the direct patronage of the shoguns. Many of the ceremonial objects and utensils traditionally presented by the shoguns for use in imperial coronations came from the workshops of these two families. Japanese gold lacquer became well known in China, and during the reign of the Chinese emperor Hsüan-tê (1426–35) a Chinese lacquerer was sent to Japan in order to learn this Japanese technique. On the other hand, the importation of Chinese carved lacquer stimulated the Japanese to produce imitations of this type.

Although the Momoyama period lasted less than half a century (1573–1615), it is distinguished by a number of notable artists. Under the patronage of the military dictator Toyotomi Hideyoshi, they produced numerous masterpieces. Kōami Chōan (1569–1610), made an inkstone box which represents the height of the perfection reached in this medium. Landscapes in *taka-maki-e* reproduce a number of paintings which had been prized since the time of the 14th-century Ashikaga shoguns. One type of lacquer decoration is peculiar to the Momoyama period. This is known as Kōdaiji *maki-e* and is found on architecture as well as on movable objects. The decorative motifs generally represent autumn foliage and flowers, especially chrysanthemums, in a natural manner executed by the *hira-maki-e* method. The most striking characteristic of Kōdaiji *maki-e* is the use of *nashiji* as a part of the design rather than as a background, in combination with other parts executed in flat gold. This is found in a reading stand (ca. 1605; VII, PL. 339). Other lacquer decoration of this type covered the woodwork of the interior and the furniture of Momoyama castles. Although the structure has perished, some of the woodwork may still be seen in the Kōdaiji, hence the name Kōdaiji *maki-e*. The great artistic genius Kōetsu was active at the end of the Momoyama period. The various fields and media in which he worked include lacquer, in which his treatment of pictorial subjects is bold and imaginative. In lacquer decoration (VII, PL. 336), he used thick sheets of lead, mother-of-pearl, and gold dust. This style is better known under the name of the Kōrin school.

For approximately the first two decades of the Edo (Tokugawa) period (1615–1867), lacquer surpassed even the finest work of the preceding period. Every possible *maki-e* technique was used in the decoration of an inkstone box attributed to Ryōsei (1597–1665) as well as a new form of *taka-maki-e* known as *shishiai-togidashi*. New elements were also introduced, including the inlaid ceramic frog, coral representing citrons, and a crystal disk over a cavity in which a water wheel cut in metal foil is suspended and filled with mercury. This box is representative of the golden age of *maki-e* art (ca. 1585–1630). In the *hirame* background, *gyōbu* (large gold flakes) are also used.

The artists of the middle Edo period were unrivaled in technical skill. Encouraged by the patronage of the shoguns and daimios, and in many cases enjoying the position of official lacquerer, they produced superb pieces. Nevertheless, when their work is compared with that of the preceding half century it shows a lack of freedom in artistic expression. This is undoubtedly a reflection of the strict regimentation of every aspect of life under the Edo regime. An exception seems to be the work of Ogata Kōrin (1658–1716; q.v.), who worked independently and was not confined by an official position. In his famous inkstone box, he followed the technique of Kōetsu, with flowers in mother-of-pearl, leaves of gold dust, and a leaden bridge, creating a strong design that contrasts, for example, with the decoration on an inkstone box (PL. 289) by Shunshō II (1615–1707), who also lived and worked independently in Kyoto. This decoration, illustrating a passage from the *Ise Monogatari*, shows ivy leaves in various shades of gold and red and a traveler's trunk in fine *take-maki-e* with gold foil and mother-of-pearl. The box is an example of *togidashi* technique at the peak of its perfection.

Many other fine artists were active during the Edo period. A number of particularly fine signed pieces are inro (medicine boxes). It is, however, not known to what extent the *maki-e* artists designed their own decorations or copied in lacquer designs previously prepared on paper by other artists. There seems to be little doubt that the majority of *maki-e* artists relied on painters or designers for their sketches. An album containing some fifty drawings for inro decorations by Sakai Hōitsu (1761–1828) and other painters, made specially for the *maki-e* master Hara Yōyūsai (1772–1845), is in the Museum of Fine Arts in Boston.

The later Edo period (ca. 1750–1867) was, on the whole, an age of decadence in which *maki-e* artists merely imitated the work of their predecessors. After the overthrow of the shoguns in 1868, artists such as Zeshin and Shōmin originated new and free ideas. Today, contemporary lacquerers are striving to create new forms, but although many of them are skilled workers, they have perhaps less incentive than their predecessors under the patronage of the shoguns and daimios.

Techniques. For the sake of clarity, the term *urushi* will be used to designate the liquid material derived from the sap of the lac tree with which the lacquerer works. The term "lacquer" is used whenever possible to indicate the finished product of the lacquerer's art.

A lacquer object is generally built upon a core or matrix of wood fashioned into the form determined for the finished object. Upon this form, strengthened at the joints with *urushi* paste and overlaid with hemp, linen cloth, silk, or paper, soaked in *urushi*, a number of successive coats of *urushi* mixed with stone powder are applied, followed by many more coats of transparent or black *urushi*. Each coat, including the soaked cloth, is allowed to harden in a very damp and entirely dust-free atmosphere and is ground smooth before the succeeding coat is applied. The number of coats varies with the quality of the object and the intentions of the lacquerer. Good black lacquer is built up of thirteen or more coats, while carved lacquer may be coated a hundred times before it is ready for the carver's hand.

Comparatively few pieces made of gold lacquer (except for the sculptured varieties) are finished by means of one process only. Indeed, more elaborate pieces not only include most of the varieties mentioned below but also employ additional elements such as inlays of various materials.

1. *Maki-e* (sprinkled picture). As the name implies, the art of *maki-e* is fundamentally a decoration produced by sprinkling gold particles on a design painted with adhesive *urushi*. This basic principle is applicable to most of the techniques described below. The general process may be given briefly here. The design is first prepared in black ink on thin, translucent paper. The outlines of the various figures or patterns are traced on the back in iron-red lacquer. Then the paper bearing the design is placed right side up with the design against the black-lacquered object; under pressure the outline in red lacquer is transferred to the black surface. A yellowish powder is then dusted over the wet transferred lines to provide an accurate guide. The *maki-e* artist, following the guidelines, then draws or paints with red lacquer the area which is to be covered with gold dust. Gold dust of fine grain is brushed on from one side with a brush of soft hair; coarse dust is strewn from above through a tiny sieve. When the lacquer has hardened, the gold design is coated either with thin transparent *urushi* or with thick black *urushi*, preparatory to burnishing or grinding.

The term *maki-e* is often used to include all kinds of gold, and even colored, lacquer.

2. *Makkinru* (gold-filing decoration). This is the earliest form of *maki-e* in which gold is used in coarse filings and finished in the *togidashi* method (see below).

3. *Togidashi* (revealed by grinding). The gold-dust sprinkled design is carried out on the ground immediately preceding the application of a final layer of black *urushi*. When the last coat, covering the entire surface, is dry, it is ground evenly with charcoal until the gold design is revealed. Polishing follows.

4. *Heidatsu* (literally, "leveled off") or *heimon* (flat pattern). This is carried out in the *togidashi* technique. Gold and silver foils cut into patterns are used in place of gold and silver dust.

5. *Raden* (mother-of-pearl inlay). A flat piece of mother-of-pearl is shaped to a desired pattern and imbedded in a lacquer ground before the final opaque *urushi* coating is applied. The piece is then finished in the *togidashi* method. In the later periods, mother-of-pearl cut almost as thin as paper was used.

6. *Chiriji* (gold-dust ground). The ground is produced by a layer of coarse gold dust flattened under pressure; the particles are brought out in the *togidashi* method. A ground thickly covered with gold dust is called *heijin* (flat-dusted).

7. *Ikakeji* (richly sprinkled gold ground). Gold dust, sieved to a uniform size, is thickly applied on a wet *urushi* surface. When hard, it is coated with translucent *urushi* and burnished.

8. *Hira-maki-e* (flat sprinkled picture). In this technique, the design is painted in *urushi* on a polished lacquer surface and gold powder is brushed over it. When dry, the adhering gold is given a very thin coating of clear *urushi*. When this has hardened, it is burnished.

9. *Taka-maki-e* (raised sprinkled picture). The principal difference between this and the preceding technique is that here the design is in relief rather than flat. The relief is obtained in various ways: (*a*) by repeating *urushi* layers; (*b*) by modeling with a combination of *urushi* and whetstone powder; (*c*) by covering the wet *urushi* design with charcoal or pewter dust to increase the height. After the raised design is smoothed with thickened *urushi*, the gold is applied.

10. *Tsuishu* (carved red lacquer). The ground for carving is usually formed on a wooden base by building up many layers (80–250) of *urushi*. In addition to red, there are carved lacquers in black, yellow, and green, and still others comprising layers of different colors. In *kōka-ryokuyō* (red flowers and green leaves) the ground is built up by repeating red layers for flowers and green layers for leaves according to a prearranged plan. *Guri* (curves and rings) is the variety which shows spiral patterns gouged through many layers of various colors. Imitation carved lacquer is usually made on a wood or composition ground and coated with colored *urushi*. Kamakura *bori* has a wood ground.

11. *Kirikane* (cut metal foil). Gold or silver foil is cut into tiny rectangles, then used individually or in combination with gold dust. This process is similar to *heidatsu*.

12. *Hirame* (literally, "flat eyes"). Grains of gold filings are flattened by pressure, forming irregular flakes which are strewn either sparsely or densely as a background. It is an advanced type of *chiriji*. In *oki-hirame*, large *hirame* flakes are laid on one by one.

13. *Nashiji* (literally, "pear-skin" ground). Because of its appearance, *nashiji* ground has been called "aventurine" in the West. The *nashiji* flakes are smaller and thinner than those of *hirame*; they are sprinkled densely and coated with clear *urushi* which then receives the usual polishing.

14. *Shishiai-togidashi* (literally, "robust flesh," with *togi-*

dashi). The term suggests modeled relief gradually diminishing into the *togidashi* method; it represents a combination of almost all the known techniques.

15. *Gyōbu* (a personal name). Flakes are made by tearing gold foil and are applied in the same manner as *oki-hirame*.

Kojiro TOMITA

IRAN AND THE ISLAMIC WORLD. The technique of lacquer painting was introduced into Iran from China in the 15th century, during the rule of the Timurids (see TIMURID ART). Herat, the Timurid capital, was a great center of learning and of the arts, where miniature painting, book illustration, illumination, and binding thrived. In Iran, lacquer painting was the product of a close cooperation between miniaturists, illuminators, and binders. One of the earliest examples of Persian lacquer is the binding of a *Mathnavī* manuscript by Jalāl ad-Dīn Rūmī, completed in the year A.H. 887/A.D. 1483, in Herat. The title page of this manuscript, now in the Museum of Turkish and Islamic Art, Istanbul, bears the *ex libris* of the last Timurid sultan, Ḥusayn Bayqarā, whose vizier Mīr ʿAlī Shīr Navāʾī, a poet, musician, and painter, was known as a patron of the arts. The exteriors of the front and back covers of the binding are decorated with delicate floral scrolls, tendrils bearing composite palmettes, and leaves painted in liquid gold on a black background. In addition to lacquer painting, each cover has a central medallion with two pendants, corner pieces, and inner borders with a stamped and gilded decoration.

Lacquer technique was fully developed in Iran and was only later adopted in Turkey and India. Bindings were made by first overlaying the pasteboard cover with a foundation of chalk, on which a thin coat of lacquer was spread to form the ground for the painting; this was finally covered with several layers of transparent lacquer. On the top coat of lacquer, liquid gold, silver, and mother-of-pearl dust were painted and stippled.

Lacquer painting was widespread in the 16th and 17th centuries under the Safavids and continued to be popular under the Qajars (see QAJAR SCHOOL) in the 18th and 19th centuries. It was used not only for bookbinding but also for objects of daily use such as mirrors, pen boxes, and wooden doors. In the Safavid period, two types of lacquer painting existed: polychrome and monochrome. The painted decoration usually followed the styles of contemporary miniature painting and illumination, and there is no doubt that some of the finest lacquer painting was the work of great artists. According to the Turkish historian ʿAlī, the famous painter Ustād Muḥammadī painted lacquered book covers. A number of 16th-century bookbindings with polychrome lacquer painting of landscapes and figure subjects have been preserved in museums and private collections. The finest examples are those in the Musée des Arts Décoratifs, Paris; the British Museum, London; the Louis Cartier Collection, Paris; the Royal Asiatic Society, London; and the Metropolitan Museum of Art, New York.

A number of wooden doors of the 17th century and later periods are decorated with lacquer painting similar in technique to that of bookbinding. A pair of door panels in the Metropolitan Museum of Art, New York, and another in the Victoria and Albert Museum, London, from the Hall of Forty Columns (Chihīl Sutūn) are richly decorated with landscapes and garden scenes in the style of Riẓā-i-ʿAbbāsī (PL. 421). Iranian lacquered bookbindings of the 17th and 18th centuries frequently show an over-all seminaturalistic floral pattern in polychrome on a brownish-red or gold background.

In Turkey, the Persian style continued with the introduction of typical Turkish motifs. Turkish book covers of the 18th and 19th centuries have rich designs of flowering tendrils with large leaves and palmettes in gold or polychrome on a black or pale-yellow ground.

In India, during the 18th and 19th centuries, book covers, mirrors, and boxes were of lacquer painted in Persian style with the addition of Indian floral designs.

M. S. DIMAND

THE WEST. The western term "lacquer" is derived from the Persian *lak*. Lacquer was brought to the West by Venetian, Portuguese, and Dutch travelers and by Jesuit missionaries. In the 15th and 16th centuries, the type of lacquer called "Coromandel," produced in India, Korea, and Japan, was widely exported. The best examples of European lacquer were produced in Italy, France, England, Holland, and Portugal, although this work was by no means up to the Chinese or Japanese standards of perfection. The period in which most European lacquers were produced coincided with the fashion for exotic objects (the so-called *chinoiserie*) from the late 17th to the mid-18th century.

The European lacquer technique differs from the Oriental, although superficial comparison may reveal certain similarities in the brilliance of the colors and in the motifs (PL. 422). The difference is due primarily to the materials used. Real lacquer, or resin, was unknown in the West. Moreover, Western artisans did not exercise the extreme care employed by the Oriental lacquer workers; consequently, European cabinetmakers and painters were seldom able to achieve the perfection of the models they attempted to follow. Another factor was the greater freedom in imagination of the European artist; when he became tired of imitating Oriental models, he developed new designs more in keeping with his own nature and environment. At a certain point this occurred throughout Europe; the fashion for the exotic, for *chinoiserie*, gave way to a more spontaneous taste for new subjects: landscape, figures, flowers, birds, and still life. This change in taste became progressively more marked by the mid-18th century.

The Venetians were the first artisans in Italy, and perhaps in Europe, to achieve fine imitations of Oriental lacquer, and their production soon surpassed all others in both quality and quantity. At first they remained faithful to the models which reached them from China and Japan; they painted the wood with red, black, or dark-green lacquer, adding gilded decorations (either applied, alloyed with silver, or sprayed on in the form of dust) or lozenges in low relief. The decorative motifs were copied from, or at least inspired by, Oriental models; thus frequently there are figures in Chinese costume, mandarins, ladies with parasols and fans, pagodas, exotic architectural details, and plants and other natural motifs. These designs were barely indicated against a monochrome background. The lacquer object was decorated after it had been prepared with a well-polished sizing of chalk stucco, then covered with various layers of trasparent resin. This, however, was not real lacquer but a type of varnish prepared from sandarac (powdered resin of the *Tetraclinis articulata*), which produced a remarkably brilliant polish. It was used in Venice from the end of the 17th century, but the period of greatest splendor was the early part of the 18th century, when it was employed to decorate not only furniture but also small objects for daily use: trays, bowls, boxes (PL. 422), candlesticks, mirror frames, inlaid statuettes, and toilet sets. The wood most often used, especially for small pieces, was the very light *Annona cherimolia* (Peruvian custard apple). Lacquer decoration was used not only on various articles of furniture, such as wardrobes, tables, spinets, chests, beds, and cradles, but also on details of interior decoration: panels, wainscoting, window shutters, listels, cornices, and door panels. A very fine example of this style is an inner door in the Ca' Rezzonico, Venice, on which the figured decoration stands out in light relief on a yellow background with gilded details. It is somewhat Oriental in subject matter, but the wreaths of flowers are definitely European in taste. The high artistic quality of this door has given rise to the hypothesis, perhaps not wholly erroneous, that no less an artist than Tiepolo had a direct or indirect hand in its design. He is known to have been at work on the ceilings in this palace in 1758–60.

From the *chinoiserie* of the two Tiepolos (father and son) and other Venetian painters of the period, it was an easy step to the domestic subjects found on the sides and panels of bureaus, on the covers of spinets, and on the doors of wardrobes. Rustic or Arcadian scenes, landscapes with mythical and allegorical figures, often recall the work of Zuccarelli, Marco Ricci, and Guardi. Smaller pieces are decorated with floral, leaf, and plant motifs, sometimes with small animals, butterflies, and birds. This change of style became more noticeable

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

about 1750. Venice competed with France in the export of such articles; while the French were superior in the perfection of finishing and in their technical abilities, the Venetians excelled in the variety of subjects, in freedom of design, and in brilliance of color.

By the end of the 18th century, color had become more uniform and decoration heavier. Moreover, a quick and economical method was devised to lacquer furniture. Printed paper was hastily painted and then varnished with sandarac. The effect achieved was brilliant but unrefined. This is the so-called "poor lacquer" very similar to the prints of the Remondini brothers of Bassano and other prints of this period. In some cases, the decorations of the Venetian Albrizzi's publications were cut out and used for lacquering purposes. The lacquerers worked with the illuminators who colored the prints used as a base for this type of decoration.

Other Italian centers followed the Venetian example. In Rome, in the mid-17th century, Father Eustache Jannart discovered a formula for a type of varnish similar to the Oriental lacquers. The painter Mario de' Fiori (Mario Nuzzi) developed this technique and decorated furniture for the Borghese family. Lacquered furniture was also produced in Parma, Ferrara, Lucca, and even in the Marches, although there it was of a more modest character ("poor lacquer"). In Sicily, lacquerers used vivid colors to achieve brilliant effects, and a Spanish influence is evident in the abundant use of gold and silver. In Piedmont, motifs of *chinoiserie* were favored; later these were combined with French styles. The lacquers of Turin compared well with the Venetian in quality. Light colors — white, yellow, pale blue — were used for backgrounds of figured scenes in the prevailing style of painting. Milanese lacquer reveals a preference for strong colors, gold illumination, and sometimes a direct imitation of Oriental models. Genoese lacquer is generally applied thinly more or less directly on the surface with very little sizing. Decorative motifs are mainly flowers, birds, and *chinoiserie* (rarely landscapes), generally in monochrome on a blue background.

Lacquered furniture was produced in France, England, and Holland. Paris was a center for lacquering, especially between 1735 and 1765. Lacquerers and other artisans worked under the patronage first of Cardinal Mazarin and Louis XIV and then of Madame de Pompadour. They decorated all types of furniture in a style of *chinoiserie* that differed from the Venetian in its wider use of metal. The French preferred dark tones — reddish-brown, blues, and greys; sometimes white was used together with gilded relief. Miniature work was done with extreme care. Guillaume and Étienne Simon Martin, in 1730, obtained a patent for a type of lacquer called *vernis Martin* and their establishments became, in 1748, members of the Manufacture Royale des Meubles de la Couronne. The Martins were very active until the end of the 18th century and were especially noted for their imitation of Coromandel lacquer. Voltaire praised the cabinetmakers and lacquerers of his time, and it is possible that great painters, including Watteau, provided designs for the decoration of furniture and the *boiserie* of the period. During the reign of Louis XVI, lacquer went out of fashion; other styles of decoration, particularly marquetry, were preferred.

English lacquerers had less imagination than their continental rivals and generally followed Oriental models. Dutch influence became prevalent in the reign of William and Mary, in the last years of the 17th century. The style of William and Mary is characterized by simplicity of line and decoration with monochrome backgrounds, either dark red or black with gold in the Chinese manner, a style inspired by the lacquers imported by the East India Company. English lacquer of the early 18th century followed the Oriental fashion seen also in the furniture of the period. Exotic motifs appear in the Queen Anne and George I periods, while in the Chippendale work of the second half of the 18th century the Chinese style was in high favor. Venetian influence is seen in the chests of drawers, cabinet desks, small framed mirrors, and toilet sets. During the reign of George IV, there was a fashion for exotic furniture, but in the 19th century this gave way to the neoclassical revival. The bright, polychrome, varnished decorative objects of the Art Nouveau style cannot be classified as lacquer. In the Orient, however, real lacquer continued to be produced, often on an industrial basis for export.

In recent years, a revival of the lacquerer's art has taken place in France, Belgium, and Korea, based on new techniques. In Italy, lacquerers are still active in Venice, either restoring antique pieces or producing commercial imitations of 18th-century models. An interesting attempt is now being made to return to a purely esthetic revival of this art in line with contemporary currents in the figural arts.

LA FRESNAYE, ROGER DE. French painter (b. Le Mans, July 11, 1888; d. Grasse, Nov. 27, 1925). Between 1903 and 1908 he studied at the Académie Julian, at the Ecole des Beaux-Arts, and, most significantly, with Maurice Denis and Paul Sérusier at the Académie Ranson. After painting in Brittany (1908–09), La Fresnaye traveled in Italy and Germany (1910–11). Beginning in 1912, when he was affiliated with the Artistes de Passy, he was closely connected with the cubists and exhibited with them at the *Salon des Indépendants*, the *Salon d'Automne*, and the *Section d'Or*. La Fresnaye served with the infantry from 1914 to 1918 and, after 1919, spent the remainder of his life as an invalid in Grasse. His last oil painting was executed in 1921, but he continued to draw until his death. In 1925 he exhibited at the Exposition des Arts Décoratifs. Characteristic paintings include *The Cuirassier* (1910; Paris, Mus. d'Art Mod.), *The Artillery* (1911–12; Chicago, Coll. Mr. and Mrs. Samuel A. Marx), and *Conquest of the Air* (1913; New York, Mus. of Mod. Art). La Fresnaye's work also includes sculpture, mainly of cubist inflection, and book illustrations, some published posthumously (Gide, *Paludes*, 1921; Rimbaud, *Les Illuminations*, 1949; and Claudel, *Tête d'or*, 1950).

About 1911, having first submitted to the influence of Gauguin and Cézanne, La Fresnaye began to evolve a more personal idiom dependent on cubism. Generally his cubist work does not reach so complex a fragmentation as Picasso's and Braque's but retains a more traditional sense of French classical order in its legible geometric stylizations and lucid structure (IV, PL. 78). While he usually adhered to the familiar themes of still life and landscape, La Fresnaye occasionally celebrated such contemporary motifs as aeronautics and military mechanization. About 1914, following the evolution of cubism in general and the style of Léger in particular, he experimented with compositions of flatter, simpler planes, and after about 1920, he began to restore the unfragmented integrity of objects in his portrait drawings and scenes of peasant life.

Robert ROSENBLUM

LANCRET, NICOLAS. French painter (b. Paris, Jan. 22, 1690; d. Paris, Sept. 14, 1743). Lancret first studied under the history painter Pierre Dulin and at the Royal Academy, but after a failure in 1711 in a competition for history painters, in 1712 he entered the studio of Claude Gillot, whose *fêtes galantes* were then coming into vogue. During the years spent with Gillot (1712–17), Lancret met Jean Antoine Watteau, another of Gillot's pupils. Watteau profoundly influenced Lancret, persuading him to set out on his own and to turn directly to nature for inspiration. In 1719 Lancret was admitted to the Academy. Within a short time his works became extremely popular and remained so throughout his career. He enjoyed the patronage of Pierre Crozat, the Duc d'Antin, and other leading amateurs and received official commissions as well. Engravings after his works were also extremely popular and, with the aid of a royal patent which protected reproduction rights to many of his paintings, he was provided with a steady source of income. With Lancret's death the vogue for the *fête galante* died out.

In his chosen genre Lancret was overshadowed by Watteau, but after the latter's death in 1721 and that of Gillot the following year, he and Jean-Baptiste Pater were the leading painters of "modern subjects." Although Lancret did some portraiture and occasionally such series as the seasons (VI, PL. 76) and the ages of man (V, PL. 411), the bulk of his output — rustic scenes or courtly amusements — falls under the classification of *fête galante*. Unlike his more famous contemporary Watteau, Lancret painted no religious or mythological subjects. Toward the end of his career, however, when he became interested in the theater, subjects from the *commedia dell'arte* and others reflecting the comedies of Dancourt and Marivaux at the Théâtre Français became common themes for his paintings. Like Watteau, Lancret frequently drew from the model, incorporating and often repeating the drawings in his finished paintings. His work is characterized by extreme delicacy in the grouping of figures, gentle color harmonies, and suffused, silvery lighting. His touch is broader than Watteau's, his brush more heavily loaded with pigment, and the mood of his paintings somewhat less ethereal. Representative of his work are *The Four Seasons* (1738; Paris, Louvre), *The Pleasure Party* (1735; Chantilly, Mus. Condé), *Dance in a Park* (1738; London, Wallace Coll.), and *The Dancer La Camargo* (1730; Washington, D.C., Nat. Gall.; V, PL. 413).

LANDSCAPE ARCHITECTURE. The artificial arrangement of cultivated areas into geometric or free patterns to achieve a purely esthetic result has always been considered a creative art form. It may also be regarded as an extension of architecture into its surroundings. Landscape architecture as a branch of the architectural discipline has been at times the determining factor in the design of specialized architectural forms such as terraced gardens, porticoes, and pavilions for the enhancement of the existing landscape.

In the figural arts, particularly in certain ornamental forms such as tapestry and carpets (q.v.), gardens appear as iconographic elements of great importance. Their use may be either decorative or symbolic. In literature, gardens appear as both subjects and settings. These artistic and literary sources provide a basis for a historical and documentary survey of the development of landscape architecture in several cultures over a period of more than three millenniums.

SUMMARY. General considerations (col. 1066). Antiquity (col. 1070): *The ancient Near East; The classical world.* The Orient (col. 1074): *Islam; Pre-Islamic India and southeast Asia; China; Japan.* Primitive civilizations and pre-Columbian America (col. 1084). The West (col. 1084): *The Middle Ages; Renaissance and baroque periods; The 19th and 20th centuries.*

GENERAL CONSIDERATIONS. As an enclosed area cultivated with special care, the garden in its primitive form is an expression of the concept of individual possession of natural resources. It represents a qualitative and esthetic maximum that can be achieved in the practice of agriculture. Landscape architecture has the same significance and esthetic values as other specialized handicrafts such as ceramics, glassmaking, and the working of precious metals. In common with these, landscape architecture has a utilitarian origin: the most ancient descriptions of gardens indicate that they were orchards or kitchen gardens, such as the garden of Alcinous in the *Odyssey*. The fact that landscape architecture is based on a natural element with fixed formal configurations to which we already attribute esthetic values (even though it may subsequently be improved) does not limit its esthetic possibilities any more than certain other arts are limited by such a basis. The fundamental element of the dance is also natural, but its esthetic legitimacy is not questioned.

The character of landscape architecture of the most ancient times appears to have been twofold, based on the choice of plant species (and consequently the selection of the best type of the species) and the distribution of cultivated plants. The choice of species and selection of varieties represent an agricultural phase in the development of gardens, since the quality of plants depends in large measure on the care taken in their cultivation. Plant distribution is also determined to a large extent by agricultural considerations, such as exposure to sun and proximity to irrigation sources; but the over-all design of the garden, geometrical patterning, and division into symmetrical areas of vegetation can be seen as an architectural phase in garden development. Landscape architecture was originally determined by principles derived from horticultural practices. Most sources agree that the basic criteria of plant distribution were conditioned by the most favorable location for the several

UP State Museum, Lucknow

species of plants, the distance required between each tree, the available sources of water, and the means of regulating its flow. Another fundamental criterion was the necessity to organize plant distribution so as to ensure a crop production for every season and a flourishing appearance to the garden.

The formal aspect of the garden changes with each season, and its appearance throughout history is that of a miniature of nature itself. Natural phenomena are brought to a level of perfection depending on the effectiveness of human activity in attenuating the excesses of nature and in stimulating those qualities most suited to the interests and requirements of man. Landscape architecture expresses the concept of nature as beautiful and propitious for human existence, implying that natural beauty can be perfected by the agency of man and that it can be isolated and put to use by a choice of the best among natural values.

Because of certain common roots, the physical evolution of landscape architecture and the development of religious practices are closely related. Fundamental to concepts of landscape architecture is the myth, common to all known historical civilizations, of a terrestrial paradise or a lost perfect harmony between man and nature. It is known that in ancient times there was a direct relation between gardens and certain agrestal and domestic cults: particular sections of gardens were dedicated to a *genius loci*; certain trees and springs were considered sacred; and small temples and votive steles were erected within the precincts. Christianity retains this ancient symbolism: the resurrected Christ appears to Mary Magdalene in an orchard or garden, as if to emphasize the state of purity to which nature has returned after the divine sacrifice. Fra Angelico represents paradise as a flowering garden, and Botticelli conceives of "ideal nature" as cultivated and controlled.

The concept of an "ideal nature" was spontaneously associated with a further concept wherein its enjoyment was not vouchsafed to all men but was granted only to the educated and sensitive, an elite easily identifiable as the more cultured and wealthier social strata. Religious considerations in the composition of the garden thus gave way to sociological considerations. These are easily documented. Less emphasis was placed on the formal structure of the garden and more on its delimitation and enclosure. (The etymological root of the word "garden" is related in meaning to "enclosure"; Old High Ger. *gard*, to surround.) A typical example of the convergence of religious and sociological elements is found in the *hortus conclusus* (enclosed garden), which in later Gothic painting served as a background for both sacred and courtly profane subjects. A gradual shift of emphasis from enclosure to ground plan appeared with the decline of the feudal hierarchical social structure.

During the Renaissance the interest of the landscape architect was focused more and more on geometric and perspective considerations, which made it possible to extend the garden to a much larger area; the enclosure became necessary only for practical purposes. These geometric, structural, and perspective aspects of the garden coincided with a new and radical concept of a direct relationship between the architecture of the garden and that of the villa or palace with which it was associated. Architecture, conceived as an absolute representation of space, could not fail to influence beneficially the surrounding space of the main structure. And perspective, as the structural rule of spatial vision, became the connecting link between architecture and nature, realized by means of the space and the "ideal" aspect of the garden. The progressive architectural evolution of the villa to open planimetric and freely articulated designs paralleled the development of the garden both dimensionally and in the search for more vast and varied perspectives. This was achieved not so much by the linear distribution of single elements as by the use of large masses of trees, fountains, and water courses. The garden was conceived as an ordering and formal rectification of a natural landscape, which led to the use of architectural elements and of small secondary structures within the garden. The form and disposition of these structures was determined exclusively by the possibility of placing in the garden area new architectural nuclei such as nymphaea and porticoes, designed expressly for landscaping purposes.

A further development in landscape architecture is seen in the progression of the garden from a scenic setting for the villa into an element of fusion between the architectural space of the edifice and the natural space of its setting. The garden came to be considered as a link between areas devoted to the civilized life of the owner and areas devoted to the rustic life of ordinary agricultural pursuits. This distinction between "civilized" and "rustic" is especially noticeable in French parks and gardens of the 17th and 18th centuries. The distinction represents the great abyss which by that time had developed between the wealthy urban dwellers, who sought distraction and rest in the country, and the peasants, who tilled the soil for a living. The landscape architect had to take into account not only this fact but also the specific pastimes of the garden owners, such as hunting and fishing, which required extensive spaces. Viability within the garden necessitated wide avenues, walks, alleys, and footpaths, and reproduced on a smaller scale the topography of the open country.

The conceptual divergence between the urban dweller and the rural peasant, in their relation to nature, conferred on the latter an importance he had never previously enjoyed. Rural life became more and more regarded by the urbanite as the authentic and "real" mode of living; and the urban dweller felt that he must in some way come closer to rural life and establish a relationship with nature appropriate to one who lives in daily contact with it. This naturalism, characteristic of the age of Enlightenment, together with a growing acquaintance with Oriental landscape architecture and a related poetic concept of the picturesque (q.v.), was responsible for the development of the "English" garden of the 18th century. Here we find an attempt to eliminate the distinction between wild and cultivated nature by reproducing a condition of the former and emphasizing its uncorrupted beauty. Thus the traditional development became reversed, to all appearances. Man was no longer trying to "educate" nature according to the precepts of his own reason and sentiment; rather nature, which in its primeval state was assumed to possess inherently all values of beauty and goodness by sweeping away social prejudice, was now educating man to find again the ethical and esthetic values of his natural origins. This enlightened philosophical concept, fundamentally sociological and pedagogical, subsequently developed into romanticism, with its contrived reproductions of the wildest and most fearsome aspects of nature. Thus the garden, understood as pure nature or as a return to nature (supposedly made convincing by human artifice), was liberated from its boundaries and its geometric and perspective formulas. In the present era, however, the garden exists only as a restricted area of transition between architecture and its ambient space or as an extended green area within the urban layout of the modern city.

The development of landscape architecture on a purely esthetic plane is rendered complex as a result of the numerous external figural and literary influences to which it has been subjected. The basis of landscape architecture, fundamentally naturalistic, lends itself directly or indirectly to poetic considerations inspired by nature.

Landscape architecture as an art, in the Latin sense of the expression *opus topiarum* (topiary work), began in the late republican era in Rome, during the 1st century B.C. The earliest examples are found in the *horti* of the urban villas, which were complexes of wooded areas and architectural elements such as nymphaea, exedrae, and porticoes. These were often of a sacred nature, either as objects of worship or through mythological association. All Roman gardens were reflections of a mythological concept of nature, especially manifested in the transformations to which certain plants were subjected. Trunks and branches of trees were trained and leaves were pruned so as to suggest either geometric patterns of idealized or enhanced natural forms, or human and animal figures alluding to historical, mythological, or allegorical subjects. Perhaps the most interesting aspect of this figured landscape architecture is the fact that the natural elements not only were used as media but also retained their natural appearance while assuming a contrived form. Fable, history, and allegory were thus considered latent in nature itself. Man's handiwork only revealed the world

UP State Museum, Lucknow

1069

of images which nature carried within itself *ab aeterno*. Thus by the distribution of certain types of plants and the attribution to them of allegorical significance, the garden became an allegorical representation of nature. The search for exotic and rare species turned the area into an idealized place where every living thing found the best conditions for its existence.

The Middle Ages viewed landscape architecture as an arrangement of an enclosed space, inaccessible to the outsider, where supposedly nature could once again find the original purity of creation. The medieval garden type was the monastery cloister — a place for withdrawal and meditation, girt by walls and surrounded by an arcade (PL. 426). It was cultivated as an orchard and filled with flowers. The well in the center was symbolic of the *fons salutis*; in secular gardens the well was replaced by a fountain as a symbol of eternal youth (PL. 427). There is an apparent thematic analogy here between ascetic literature and monastery gardens on one hand, and romance narrative and secular gardens on the other.

During the Renaissance, landscape architecture became closely related to the figural arts. Common ground was the interest in problems of perspective; the formal relation between gardens and buildings, which tended more and more to assume the forms of sumptuous mansions; and the typically Humanistic tendency to consider the garden as a type of arboreal architecture. In Renaissance treatises, especially those of L. B. Alberti and Francesco di Giorgio, the garden is represented as "ideal nature," the agricultural parallel and complement to the geometrically planned "ideal city."

In the second half of the 16th century, the spread of mannerism added many new elements to the figural and perspective forms of landscape architecture. The garden, which had hitherto been an idealized natural site, became a place where the art of ancient times could find a most appropriate environment. Statues, ruins, architectural fragments, and sarcophagi became the typical decoration in an age with a passion for the "discovery" of antique art. It was believed that the beauty of the art object, whether ancient or not, would return to its original and profound significance if placed in a natural setting. Gardens were gradually filled with small edifices such as nymphaea, exedrae, and small temples, all made to look ancient and sometimes even in the form of ruins. A new art came into being: a form of garden sculpture representing mythological subjects, often drawn from theatrical scenes. The intentionally unrefined but vividly pictorial workmanship was aimed at enhancing the material by placing it in the open air and at blending the plastic forms with the natural elements, fountains, and water displays of its surroundings. A new concept of a "capricious" nature, filled with unexpected and contrived details, took the place of a "regulated" nature. The landscape architect joined forces with the building architect and the hydraulic engineer; together they devised bizarre perspective effects, water displays, springs, and labyrinths. The prevailing fashion for open-air theatrical performances and the descriptive literature of this period (especially the works of Torquato Tasso), in which the miraculous was a dominating element, also brought a close collaboration between landscape architect and scenic designer. In gardens conceived as miraculous, fantastic, even enchanted places, all the formal limitations were cast aside. The garden thus became an area of natural setting for the expression of human sentiments.

The taste for the picturesque (q.v.) and Sir William Chambers' description (1774) of Chinese landscape architecture strongly influenced the 18th-century English garden. Here nature was allowed to retain its primitive character, and the only limitation was the "correction" of lines and forms in accordance with an ideal concept of nature. The philosophic basis of English landscape architecture was strongly influenced by the writings of Pope, the esthetics of Shaftesbury, the artistic theories of Alexander Cozens and Uwedale Price, and the social functions of the gardens themselves. Gardens were places not only for rest and conviviality but also for sports, especially hunting. The first real theories and principles of landscape architecture as such were formulated in England by men like Thomas Girtin (q.v.) and were placed on an equal footing with the theories and principles of the figural arts and architecture. Wide knowledge of distant lands — India, China, and America — enriched the European gardens, especially English gardens, with many exotic plant species. At first regarded as curiosities, these plants were gradually cultivated, acclimatized, and diffused.

In the 19th century the gardens of the wealthier classes tended to disappear or to become public parks, and their character became more and more determined by scientific interests. The botanical garden may be considered the last expression of a formal philosophic basis to landscape architecture. The esthetic does not differ substantially from the scientific philosophy that flourished in the 19th century.

Giulio Carlo ARGAN

ANTIQUITY. *The ancient Near East.* Our knowledge of the landscape architecture of the ancient Near East is limited to the two major civilizations: Egyptian and Mesopotamian. For other civilizations both literary and archaeological data are lacking, with the partial exception of Elam, for which some fragmentary information has reached us through Assyrian reliefs.

In Egypt the most salient characteristic of landscape architecture was the widespread use of flowers for decorative purposes in the gardens of private dwellings and public buildings. Flowers were also used generally on ceremonial occasions, both sacred and profane. Most widely used was the lotus, in two varieties: blue (*Nymphaea coerulea*) and white (*Nymphaea lotus*). Among other flowers that appear as decorative elements in the figural arts are the chrysanthemum, jasmine, and oleander, arranged in wreaths or bunches. In the New Kingdom, extensive gardens were laid out to constitute an organic unit with the great lordly dwellings. Generally these gardens were plantations of fruit trees providing cool and agreeable places where the inhabitants of the residential complexes could rest and amuse themselves. Other elements found in Egyptian landscape architecture were artificial pools and kiosks built of light materials. Networks of canals provided water for irrigation. In the houses at Tell el 'Amarna, capital of the pharaoh Akhenaten, a number of gardens with all the characteristic elements of the period have come to light. These gardens were enclosed within the walled perimeter of the dwelling unit. The principal species of trees, planted in rows, were the date palm (*Phoenix dactylifera*), doom palm (*Hyphaene thebatica*), sycamore fig (*Ficus sycomorus*), acacia (*Acacia nilotica*), bito (*Balanites aegyptica*), and tamarisk (*Tamarix nilotica*).

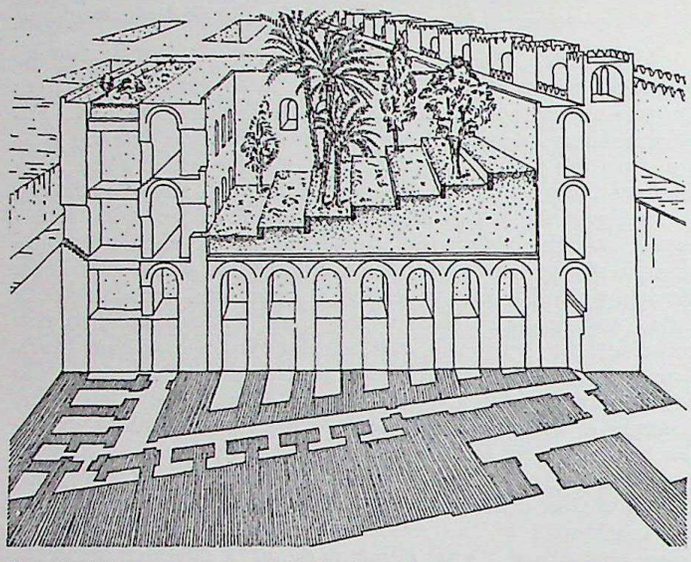
The Theban tomb of Rekhmira (No. 100), reign of Thutmosis III, contains an image of a garden of a private house (IV, PL. 371), shown in perspective. At the focal center is a quadrangular pool surrounded on all sides by rows of trees planted on three levels, one above the other, the trunks converging toward the center. The tree species represented are the sycamore fig, doom palm, and date palm. On one side of the garden is a small kiosk. The owner is seated in a small light craft floating in the pool, towed by two ropes on the shore. Two gardeners are watering the plants. Each carries two buckets attached by a rope to a wooden pole carried across the shoulder. Other representations of gardens are found in the tomb of Amenemheb (No. 85), reign of Thutmosis III, and in the tomb of Sebekhotep (No. 63), reign of Thutmosis IV. In both these Theban tombs a pool is shown surrounded by trees in parallel rows. The gardens are all depicted longitudinally. In the tomb of Ipi (No. 217), 19th dynasty (PL. 423), there is a remarkable painting of a garden with all the characteristic Egyptian elements. Four gardeners are seen drawing water from a pond by means of an elevator similar to the *shādūf*, still in use today in the less advanced agricultural areas of Egypt. The water is poured into small irrigation ditches, which carry it to the trees and flowering plants of the garden. In a number of grave paintings we find images of landed proprietors seated under arbors of grape vines.

Landscaped areas are shown in the funeral complexes of Mentuhotep II Nebhepetra (11th dynasty) and of Hatshepsut (18th dynasty). In the former, the main approach was flanked by sycamore fig trees under which stood statues of the King;

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

rows of tamarisks were planted laterally. The avenue of the Temple of Queen Hatshepsut was decorated with a row of sphinxes, and a note of color was provided by groups of trees. Two great bitos stood at the entrance, the trunks of which have been found *in situ* planted in great brick tubs containing silt from the Nile. A palm tree and a grape vine grew on the south side of the lower portico. The expedition sent by the Queen to the land of Punt (probably on the Somali coast) brought back 30 aromatic trees from whose resin incense and balms were obtained. These trees are mentioned and depicted in the reliefs commemorating the expedition (IX, PL. 1). They were transplanted into great vats in order that they might survive the journey. A study of the characteristics of these trees, as



Hypothetical reconstruction of the Hanging Gardens of Babylon, perspective section (*from R. Koldewey and F. Wetzel, Die Königsburgen von Babylon, I, Leipzig, 1931*).

depicted on the reliefs, shows them to be of the species *Boswellia thurifera*.

Literary sources furnish ample data on the flora cultivated in ancient Mesopotamia. A good example of this documentation is the inventory of plants grown in the kitchen garden of Mardukapaliddina II. These data, however, are of more botanical or horticultural than artistic interest. Further information from literary sources regarding Mesopotamian landscape architecture is generic and does not furnish any description of the actual appearance or design of the gardens. A text of Sennacherib states that this Assyrian king imported exotic species, which he planted in his garden in order to acclimatize them.

Some interesting information, although limited, can be derived from figural depictions in Mesopotamian art. The narrative character of the great Neo-Assyrian reliefs is illustrated in scenes and landscapes of the conquered cities as well as the playgrounds of the Assyrian court. These scenes have provided fairly precise information regarding the green zones of the cities. The existence of a definitely urbanistic function of gardens can be deduced from a relief of Ashurbanipal of Nineveh, which illustrates a detail of the conquest of the Elamite city of Susa (VII, PL. 253). Beyond the walls of the city proper a less thickly built zone, in which the houses were scattered under trees, extended to the banks of the river. It is difficult to determine whether this was a residential quarter or an agricultural suburb. In any case, the separation between this green zone and the walled city is very clearly depicted. Another relief of Ashurbanipal, from the same series on the wars against the Elamites, shows the enemy fleeing against the background of a hilly, thickly wooded landscape crossed by water courses. An altar stands in the middle of a road, at the end of which are several shrines. It has generally been assumed that this relief illustrates a natural landscape; but the presence of these small places of worship (similar to another relief of Ashurbanipal depicting a shrine on the summit of a hill and the King hunting in a chariot) and of some arcades holding up trees, like those in Babylon which supported the famous Hanging Gardens (FIG. 1071), suggest a royal park, elaborate in plan and filled with architectural elements.

From a study of the texts of this period we know that palaces and temples within the cities might have had their own gardens. Excavations have proved the existence of trees both within and without the Bīt Akītu of Ashur. But it cannot be established whether these were planted in a garden. The royal parks, however, must have been very large and rich in vegetation, as is suggested in the relief of Ashurbanipal (PL. 423). The famous hunting expeditions of this king took place in a park within an area surrounded by a cordon of men at arms. The absence of a landscape element in this relief is not due to a lack of vegetation but to the spatial concept of the artist, who isolated the figures in order to give them greater prominence. One relief of a royal hunting scene shows a tree-covered hill peopled with spectators, who stand behind the cordon of soldiers. In other reliefs of the period animals are shown wandering beneath the trees of the royal park, and trees form a background for a convivial royal garden scene.

The architectural function of trees can be seen not only in the above-mentioned Bīt Akītu of Ashur but also in the Hanging Gardens of Babylon, numbered in antiquity among the Seven Wonders of the World. Robert Koldewey's excavations near the Ishtar Gate have revealed traces of these gardens in a series of 14 vaulted rooms that seem to have supported a terrace planted with trees.

Sergio BOSTICCO and Giovanni GARBINI

Level or terraced gardens of the Islamic types described below existed in Mesopotamia. The royal palaces of the Achaemenian and Sassanian emperors of Persia were surrounded by immense gardens and parks. The palace at Ctesiphon, the Ṭāq-i-Kisrā, opened on such an area. During the winter an immense carpet set with costly precious stones was used as a substitute for the natural garden. This carpet was lost during the Arab conquest, but garden carpets have remained in fashion in Persia to the present day. A good example of these Persian parks and hunting preserves may be seen in the rock reliefs at Ṭāq-i-Bustān. The Persian garden became the prototype of the classical Greek *paradeisos* (paradise; see below).

Hermann GOETZ

The classical world. The art of landscape architecture was introduced into the Greco-Roman world from the Orient at the beginning of the 3d century B.C. The earliest examples appeared in Hellenistic Greece and later in Italy, particularly in Campania and in the immediate environs of Rome. Preclassic and classic Greece do not seem to have known the garden as a place for pleasure and relaxation. The Homeric period, however, had a tradition of sacred gardens surrounding sanctuaries and groves which were the dwelling places of the gods (*Odyssey*, V, 57–74, 291–93); but these were situated far from Greece proper. It is possible that the most remote origins of this Homeric tradition go back to the Aegean world and are related to pre-Greek vegetation cults. Sacred orchards containing pomegranates and vines were planted around the shrine of Herakles at Thasos and in Athens, near the Theseion. The gardens of the hero Akademos were a sacred enclosure built by Kimon; later they became a public walk.

The first purely voluptuary gardens in the West of which we have record were the celebrated Horn of Amalthea, built by Gelon in Syracuse (early 5th cent. B.C.; Athenaeus, *Deipnosophists*, xii), and the miniature gardens laid out by Hieron II on his great ship (3d cent. B.C.; Athenaeus, op. cit., v). It is probable that from this period onward the influence of the royal parks of the Persian world, especially the *paradeisos* of Cyrus at Sardis (Xenophon, *Oeconomicus*, iv, 20 ff.; cf. Pollux, *Onomasticon*, s.v. Παράδεισος), greatly stimulated the Greek imagination. The successors of Alexander adopted the idea of the "royal paradise" — parks laid out in geometric patterns, which were also the scenes of royal hunts. These parks followed a tradition that went back to pre-Persian times. The

fashion spread throughout the Hellenistic world, arousing the indignation of the philosophers, and lasted until the end of classical antiquity. Descriptions of the royal gardens constituted one of the favorite subjects of the Greek writers of the Hellenistic period.

In Rome the art of landscape architecture was introduced from two sources: the example of the "paradises" of the Sicilian tyrants and the walks that surrounded south Italian sanctuaries; and the discovery by the Romans in the 2d century B.C. of the royal gardens of the Orient. The tradition of sacred gardens is found in the Italic *luci*. The persistence of the Dionysian cults in Italy and especially in Alexandria, despite official repression, contributed to the fashion for rock gardens and sacred landscapes in private gardens. The Romans' love of luxury, their systematic imitation of Oriental magnificence, and their inborn delight in all the manifestations of nature contributed to the spread of landscape architecture. From the last years of the republic to the end of the Western empire gardens had an important place in daily life.

The earliest voluptuary gardens in Rome of which we have a record were those of Scipio Aemilianus (Cicero, *De amicitia*, vii, 25; *De republica*, i, 9) and of the general D. Junius Brutus (Cicero, *De amicitia*, i, 7). Both of these gardens were probably located near the Campus Martius. During the Sullan period in Latium there was a great increase in the number of villas with gymnasiums, promenades (ambulationes), and porticoes, inspired by the Academy and the Lyceum. An essential characteristic of these gardens was the architectural use of terraces, which was increasing. This use initiated a style from which later was to spring the style of landscape architecture of the Italian Renaissance and baroque periods. The immediate suburbs of Rome gradually became covered with gardens.

By the middle of the 1st century B.C., the Domus Tampiliana on the Quirinal contained a then ancient grove (*silva*; Cicero, *Ad Atticum*, iii, 20). And by the end of the republic, there were gardens on the right bank of the Tiber. Here Julius Caesar created the Horti Caesaris, the great park which at his death he willed to the Roman people. The Horti Clodiae were in the same quarter. Within the city itself the most important gardens were the Horti Pompeiani, probably situated near the present-day location of Piazza di Spagna; the Horti Luculliani, near Trinità dei Monti; and the Horti Sallustiani, between Via Vittorio Veneto and Via Venti Settembre.

Under the empire the number of gardens in the city increased steadily. Those of Agrippina Major (the elder), or Vipsania, were on the right bank of the Tiber. The Garden of Domitia on the Vatican hill later became the Horti Neronis. On the Esquiline hill, Maecenas began the creation of the famous Horti Maecenatiani on the ramparts of the Servian Wall. In order to build these gardens, Maecenas covered the ancient burial grounds with a thick layer of earth. In the same zone were the Horti Lamiani (near modern Piazza Dante) and the Horti Maiani, which soon became imperial property, as did the gardens of Maecenas. In the neighborhood of Porta Maggiore, T. Statilius Taurus created the Horti Tauriani, which were confiscated after he had been condemned to death in A.D. 53. Large parks also existed in other parts of the city, especially at the foot of the Aventine hill.

In A.D. 64, with the creation of the gardens of Nero's Domus Aurea (Golden House), the green zone of the Esquiline was gradually extended as far as the Caelian hill and became property of the *fiscus*, a branch of the public treasury. These gardens lasted until the Antonine period, after which they were gradually parceled. The Horti Sallustiani and the garden on the Pincian hill, which had both become the Horti Aciliani, were still in existence when the Aurelian walls were built (A.D. 270–75).

The first public garden was the promenade of the Theater of Pompey (55 B.C.), adorned with groves of trees and fountains. Augustus built porticoes around other gardens of the same type: the Portico of Livia on the Esquiline (7 B.C.), the Area Apollinis on the Palatine, and the Portico of Vipsania and the Campus Agrippae in the Campus Martius. Later, the thermae included avenues bordered with gardens.

Cicero (*Ad Quintilianum*, fr. iii, 1, 55) called the art of landscape architecture *ars topiaria*. This term, derived from the Greek, does not indicate the pruning of leaves and branches to give them an artificial shape, as is commonly believed; rather it refers to the arrangement of landscaped compositions in which plants such as ivy, periwinkle, and maidenhair were used as ornamental covers for walls and grottoes, and in which shrubs and trees (especially cypresses) bordered walks and avenues. Topiary art was an attempt to reproduce, within the garden, landscapes such as those seen in paintings. The landscape architect achieved this by means of rustic sanctuaries, shrines, tombs, statues, bridges, towers, streams, rock work (e.g., the grotto in the form of a nymphaeum; PL. 424) — all elements which figure in the painted landscape of the "sacred idyl" and in the huge wall paintings of mythological subjects. An attempt was made to reproduce the image of the countryside as seen by the painter, the idyllic poet, and the epigrammatist. The novelty of Roman landscape architecture was particularly evident in this attempt to express sentiments proper to nature, in which, as the Romans viewed it, the gods were always present.

While the expressive media of Roman landscape architecture were derived from Hellenistic models, the choice of themes and subjects remained unmistakably Roman. Thus a large number of statues were used and a strong Dionysian element was present, represented by the spirits of the most ancient Roman religion: Priapus, who replaced the ancient *fascinus*, and the satyrs, assimilated to Sylvanus and Faunus. The most perfect example of this type of composition is to be found in the park of the Domus Aurea of Nero (Suetonius, *Nero*, xxxi, 1–2), where villages, woods, fields, and an entire rural landscape were set on the shores of a lake. The Pompeian peristyles and the simpler gardens, like the one belonging to the House of Loreius Tiburtinus (PL. 425), were adorned with scenes representing a hunt or a design surrounding a shrine to the household god.

Even at a very early period the general outline of the Roman garden followed certain architectural principles. The paintings in the Auditorium of Maecenas, whose dates have not been definitely established (but which cannot be later than the end of the 1st century B.C.), show two gardens divided into a number of compartments separated by pergolas, picket fences, and arbors built of reed trellis. Similar gardens are found in the paintings of the Pompeian Style IV (PL. 424). The vistas, the contrasts of light and shadow, the quiet recesses and nooks give the garden a definitively architectural character and make it an integral part of the house. Pliny the Younger (*Letters*, ii, 7; v, 6) describes such gardens as "servants of architecture." They took various forms: a stadium or hippodrome (Palace of Domitian on the Palatine), a gymnasium, a terrace surrounded by a dense thicket (represented in the paintings of the Villa of Livia at Prima Porta, now Rome, Mus. Naz.; VII, PL. 208), a terrace enclosed within a peristyle (House of the Black Anchor, Pompeii; lower peristyle of the Domus Flavia on the Palatine). Often, as in the House of Loreius Tiburtinus at Pompeii, the median line is marked by a series of pools connected by small waterfalls, called *euripi*. The grounds of Hadrian's Villa at Tivoli are a good example of a garden broken into small units aroud a number of buildings (III, PL. 386).

The Roman garden was at the same time a sacred site, an idyllic landscape, and a place dedicated to leisure. Its Hellenistic and "royal" origins gave it an undeniably grandiose character, but Roman taste required the enrichment of the model. The practical genius of the Roman architects enabled them to integrate gardens and private dwellings and to make them a part of the new urban complex, which was one of the most original aspects of imperial Rome.

Pierre GRIMAL

THE ORIENT. *Islam.* In southwest Asia, North Africa, and parts of the Mediterranean, the ground destined to be made into a garden (*jannat* or *bāgh*) must be wrested from the desert. Water is brought from afar — from the mountains, from a wadi, or from an artificial reservoir, through an open or an underground canal (*qanāt* or *kārez*), aqueduct, or clay pipe; in some places it is drawn from deep wells. The water is dis-

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

tributed to the flower beds, which are divided into square or oblong plots through a system of clay or stone-faced irrigation canals. High walls, trees, and shrubs protect the garden from the drifting sand. While complex, this system of landscape architecture produces exuberant plant growth and flowers of exceptionally brilliant color. It is not surprising, therefore, that the inhabitants of the desert belt consider such gardens an image of heavenly bliss; and that the Oriental parks or game preserves, a simpler variant, became the prototype of the Western concept of paradise.

If the garden is on sloping terrain, it is laid out in a series of terraces. At the wall of each terrace the water flows beneath a pavilion or a stone seat, either forming a waterfall, behind which are niches for colored lamps, or running down a ribbed duct into a basin on the next level. The water pressure thus generated is used for additional fountains. The lowest terraces are the setting for public receptions, and the middle and upper terraces are reserved for the male and female members of the household, respectively.

If the garden is situated on flat terrain, the water must be lifted to a high storage tank, from which it flows to the garden pavilions built along the enclosure and to the pavilion in the center. The water courses either converge on, or radiate from, a central pool and divide the garden into four compartments (*chār-bāgh*). The banks of the canals are paved and bordered with cypresses and grape vines. The compartments, which are on a slightly lower level, are planted with fruit trees and flowers such as tulips, narcissuses, and roses.

The Balkuwāra Palace at Samarra, capital of the Abbasside caliphate (see ABBASSIDE ART) in the 9th century, has been excavated by Ernst Herzfeld. It had a vast forecourt and a similar garden in the rear. Under the Fatimid caliphate (10th–12th cent.) Egypt was filled with gardens of astonishing luxury. Among the famous garden palaces were the Western, or Golden, Palace in the Garden of Kāfūr, built by al-'Aziz (975–96), and the golden al-Lūlua, west of Cairo, on the Nile Canal. Both gardens contained lakes, golden trees, extensive greenhouses for roses, silver gondolas with golden awnings, and so forth. The later caliphs were wont to spend their days in these gardens, dallying with singing and dancing maidens.

Islamic gardens are found as far west as Morocco and, in Europe, Sicily and Spain. At Palermo, Arab landscape architects designed the Favara, the Zisa, and the Cuba for the Norman kings of Sicily (12th cent.). In Morocco there were gardens at Fez and Meknes. In Spain the summer residence of the Ommiad caliphs (see MOORISH STYLE) at Medina az-Zahra, near Cordova, was built along the slopes of a mountain on three terraced levels, one containing the palace, one the gardens, and the third the town and great mosque. At Granada, capital of the Nasrid dynasty (1232–1492), three palaces have been preserved: the Alhambra (al-Ḥamrā, or "Red Castle"), the Generalife (Jannat al-'Araf, or "Garden of the Architect"), and the Alcazar Genil (now part of a modern mansion). The Alhambra, begun by Muḥammad I Ibn-al-Aḥmar (1232–73), opens on various courts and gardens (Court of the Myrtles, Court of the Lions, etc.; X, PLS. 166, 167) with water courses and fountains. The Generalife, a summer residence, is much simpler: it is crossed by one canal, into which a series of fountains on both sides scatter their waters. The splendor of these Islamic gardens, filled with beautiful maidens, fired the imagination of Frankish travelers and crusaders and inspired the medieval legends of the magic gardens of Armida and Klingsor.

The Islamic garden is celebrated in Persian painting and literature, especially in the works of the 12th-century poet Niẓāmī. The only extant gardens of this type, however, are those dating from two dynasties — the Safavid (16th–18th cent.; q.v.) and Qajar (19th cent.; q.v.). Among these gardens are the palace gardens at Isfahan built by Shah 'Abbās I (1587–1629) and Shah Ḥusayn (1694–1722); the gardens of the Palace of Ashraf near Asterabad (now in ruins) begun by Shah 'Abbās I in 1612, where seven gardens are decorated with fountains, pavilions, baths, stables, and murals in the Persian and European styles; the gardens at Safiabad and Farahabad (also in ruins); the Gulistan Palace at Teheran; and the Bāgh-i-Takht at Shiraz.

In Istanbul, the Topkapı Saray (15th–18th cent.), the palace of the Ottoman Turkish sultans, has canals, basins, fountains, and garden buildings (Chīnīlī Kōshk, Throne Hall, and the Baghdad Kōshk) in an eclectic Persian-Egyptian-Byzantine style. The landscape architecture does not adhere strictly to the Islamic style, since the climate of the northeastern Mediterranean coast renders irrigation unnecessary.

The largest number of well-preserved gardens in the Persian style can be found in northern India and the Deccan. From the pre-Moghul period (before 1550) there are vestiges in Kotila-i-Fīrūz Shah in Delhi of a 14th-century garden around a deep well. There are also vestiges in the Bahmanī palaces at Bidar (15th cent.), between the Takht Mahal, Chīnī Mahal, and the Sōlakhamba Mosque (the principal pavilion, known as the "Commandant's House"). The gardens of Maḥmūd I and Ghiyās-ud-Dīn at Mandu (15th and early 16th cent.) around Lake Munja and the Kapur Talao had many fountains, sluices, and water courses. Other examples in the area were the water palace of Kumatgi near Bijapur (late 16th cent.) and the gardens and deer park at Mahmudabad in Gujarat (early 16th century, once flanked by four halls with high wooden pillars behind which were four harems; the ruins of only one harem are extant).

From the period of the Moghul empire (1526–1857), the earliest extant Persian-style gardens — all early 16th to early 17th century — are the Ārām Bāgh at Agra, the tombs of Bā-Halīma and Humāyūn at Delhi, the mausoleum of Akbar at Sikandra, and the mausoleum of Āṣaf Khan at Shahdara (Lahore), the last in pure Safavid-Persian style. The imperial type of garden developed under Shah Jahān (1628–58) was on the Persian plan but with costly pavilions of white marble. In the forts at Agra, Delhi, and Lahore, there were garden courts of this type surrounded by open sleeping and living quarters. The Angūrī Bāgh (Grape Garden) at Agra had a women's bath and curved marble ledges between the flower beds (PL. 446). There are other imperial gardens in the Red Fort at Delhi: the small gardens in front of the Dīwān-i Khās, — the Rang Mahal, and the Mumtaz Mahal; and the larger gardens of the Mahtāb and the Hayāt Bakhsh, with the Shāh Burj, Bhādon and Sāvan pavilions, and the Ẓafar Mahal (bath), all framed with costly marbles. Outside the cities imperial summer retreats and pleasure gardens (Shalimar Gardens) are located near Delhi; near Lahore, Pakistan (PL. 446); and on Lake Dal in Kashmir. Others include those on the lake called the Ana Sagar near Ajmer, the Chasma-i-Shāhī in Kashmir, and the one at Achabal, also in Kashmir, with its many pavilions divided by walls. Princes and nobles also built gardens, such as those of the Raushānārā Begam near Delhi, the Zēbinda Begam near Lahore, Nishāt Bāgh and Parī Mahal in Kashmir, Pinjaur in the Punjab, and several near Rauza (Khuldabad) in the Deccan. Gardens were also laid out around mausoleums, such as the Tāj Mahal at Agra, those in Shahdara near Lahore, and the Bībī-kā Maqbara at Aurangabad.

In the 18th century there flourished a sort of Moghul "rococo" style, of which two examples are the Qudsiā Bāgh, comprising a huge enclosure filled with a mosque, pleasure houses several stories high, and a complex system of basins, fountains, and water courses, at the end of which is a view over the Yamuna River; and the mausoleum of Nawab Sāfdar Jaṅg of Oudh at Delhi (PL. 169). The latter was originally used as a palace and had living quarters around the vast area surrounding the central tomb.

Rajput gardens in the Moghul style are found at Amber, Jaipur, Jodhpur, Bikaner, Udaipur, Bundi, Alampur, and Nadaun (Himalaya); those at Dig, between Delhi and Bharatpur, are among the finest. The Rajput gardens were often situated on or below the dikes of irrigation lakes. Today the taste for this refined art has been lost. The "Moghul" garden of the Rashtrapati Bhawan (former Government House) at New Delhi is actually of the Italian type.

Gardens in a semi-European, or semi-Chinese, style, built in the 19th century, include that of Mubārak Shah at Delhi and the Kaisar Bāgh and Sikandar Bāgh, both in Lucknow.

1077

Pre-Islamic India and southeast Asia. In the hot climates of India and southeast Asia, gardens are natural habitats, save during the hottest months, when people seek shelter indoors. Most houses are built around a courtyard garden; larger mansions are surrounded by extensive parks and gardens, and palaces consist of many buildings spread over a vast landscaped area of courts, gardens, and groves of trees. The towns are ringed about with large green areas.

The Indian hermitage, or ashram, the modern math, is generally situated in a grove or forest. The Buddha was born in a garden; he preached his first sermon in a garden and died in another. The sites of Buddhist monasteries were either in a garden (*ārāma*) or on the side of a mountain in a setting of natural beauty. Almost all the Hindu temples rise in the midst of gardens or on the banks of a river or lake. In the zone of the wet monsoons (eastern and southern India, Ceylon, and southeast Asia) the garden, with its exuberant vegetation, ponds, and hills, where wild animals were sometimes kept, was a stylization of nature. In the dry desert belt of southwest Asia (including northern India, Pakistan, and the Deccan), it was an artificial product made possible by complex and laborious methods of irrigation.

None of the ancient Indian gardens has survived, although literary works are filled with references to them. The Ajanta murals depict gardens with lightly constructed pavilions of wood and brick. These were copied from the royal gardens of Ceylon, of which an example is found at Anuradhapura below the Tisaveva dike. These gardens have rectangular lotus ponds, a central lake with a pleasure island, rock cliffs decorated with reliefs of elephants swimming in lotus pools, underground rooms, bathing pools, and wooden pleasure houses. Parts date from the time of Mahāsena the Great (A.D. 334–61). At the southern end is 5th- to 6th-century Isurumuniya, with a rock temple, rock reliefs, and a beautiful temple terrace. A further example in Ceylon is the royal garden town at Sigiriya (late 5th cent.), a fortified quadrangle in which the palace proper is arranged around four square basins. The palace is connected with the rock fortress to the east by an oblong garden with stone embankments; these embankments are flanked by pavilions built on artificial round hills that are set in the center of square ponds.

At Polonnaruva, Ceylon, the fortified palace square is north of the Topaveva (12th–13th cent.). The principal edifice (Vaijayanta Prasāda) rises from a special court to a height of seven stories. In its vast garden area there are richly decorated stone terraces and numerous ponds. The great monasteries of Āḷāhana Parivena (to the west) and Potgul Vehera (to the east) are set in the midst of extensive gardens with underground chapels and rock sculpture; the great Buddha images at Gal Vihara are noteworthy examples of rock carving (see CEYLON; CEYLONESE ART).

In India we can interpret the two great 7th-century reliefs inspired by the Kirātārjuna story (commonly known as "the Descent of the Ganges" or "Arjuna's Penance") at Mamallapuram (IV, PL. 256) and the adjoining Kṛṣṇa Mandapa as the last remnants of a royal pleasure garden laid out beneath the ramparts of a one-time fortress. The unexcavated palaces of the Chola emperors of southern India at Uraiyur (near Tanjore), at Gangaikondacholapuram, and at Kumbakonam (11th–12th cent.) consisted of vast areas covered with mounds and pools. The palace of the Rāyas of Vijayanagar (16th cent.; see DRAVIDIAN ART) had great terraces supporting wooden superstructures surrounded by vast courts, one of which stood in the middle of a lake. The Hindu style of a square lake with one or more islands in the middle and palaces on the banks was adopted by Moslem landscape architects. Examples of this type of garden are in the harem of the Jahānpanāh citadel (15th–16th cent.) at Champaner, Gujarat; Bijay Mandal (part of Hazār Sutūn; mid-14th cent.) at Siri, Delhi; Hauz-i Khās (late 14th cent.), Delhi; and the Rūpa Laṅkā and Sonā Laṅkā islands of Sultan Zain-ul-'Ābidīn (15th cent.) in Lake Dal, Kashmir.

Examples of gardens outside India are, in Nepal, those of Budha Nīlakaṇṭha and Bālajī, with many fountains along the terraces; in Burma (at Mandalay), the fort gardens and the royal pleasure gardens southeast of the fort (19th cent.), both oblong rectangles of canals and ponds; in Java, the *kraton* (palace complex) of the kings of Majapahit described in the *Nāgarakṛtāgama* (1365) of Prapañca, the ruins at Mojokerto, the *kraton* of Jogjakarta, that of Sūrakarta, and those of the princes on Bali. In Cambodia, the ruins of the royal palace at Angkor Thom consist of a series of relief-covered platforms facing the public square and a system of pools, shrines, and stone platforms behind the square (PL. 374).

Today this highly refined form of landscape architecture of pre-Islamic India and southeast Asia has degenerated, subject to Persian influences in India and to Chinese influences in southeast Asia.

Hermann GOETZ

China. Chinese landscape architecture, with its asymmetric and indeterminate character, attempts to create an atmosphere of solitude and isolation. In China it was the great painters who created the typical Chinese garden, following the principles of their pictorial art; particularly important was the *shan-shui* (mountain and water) school of landscape painting. Gardens were composed of fairly isolated sections which, although part of a homogeneous composition, were intended to be observed gradually as the visitor walked along the paths.

The Chinese belief that water is an indispensable element in landscape architecture has its origins in the Taoist theory that water courses are the arteries of the earth, through which flows the universal life spirit. The most common use of water in Chinese landscape architecture is an island-studded pool surrounded by buildings (PL. 447). Mountains represent, in Taoist thought, the earth's skeleton. Perforated and grooved stone blocks (called "mountains"), which are placed around the pool or scattered among the flower beds, constitute the most original element of Chinese landscape architecture and occur in no other type of garden (PL. 447). These stone blocks assume all sorts of shapes but fall generally into the two formal categories of horizontal (rocks of small size usually set in layers and held together with mortar to form miniature mountains, grottoes, and tunnels) and vertical (rocks of any size with the long axis placed vertically). Some of the largest are considered monuments and are set on pedestals in open spaces. They are analogous to the obelisks found in Western gardens. Most highly prized are limestone blocks, naturally formed, from T'ai-hu and other lakes in southern China. Stones and rocks from the mountains, modified by the hand of man, are also used.

In addition to these "permanent" elements, trees and flowering plants are grown, which complete the beauty of the garden when they blossom. Many plants have a symbolic character. Bamboo, because of its flexibility, resistance, hardness, and pliancy, is a symbol of lasting friendship, of vigorous age, and, above all, of the *chü-jên* (gentleman) who bows beneath the weight of adversity but rises again after every storm. The pine is a symbol of a strong and firm character and, because of its height, of silence and solitude. The plum tree, as popular in China as the cherry in Japan, is regarded as the herald of spring and bringer of life. Among the flowers the orchid symbolizes feminine grace, the chrysanthemum longevity, and the peony wealth and happiness. The lotus is considered the supreme element of beauty. Because of the peculiar luminosity of its flower, and because it rises from the muddy bottom of a pool to the surface of the water, where the light of the sun enhances its beauty, the lotus is a symbol of the desire to rise above the material world toward the enlightened spheres of the spirit; it is the symbol of pure Buddhist doctrine and the central theme of Buddhist artistic symbolism (see BUDDHISM).

Pavilions in Chinese gardens are open or completely enclosed and occur in various shapes: square, rectangular, round, polygonal, and crescent; they may also be built in the shape of a plum blossom or a Greek cross. The pavilion is used as a place in which to study and meditate or as an observation point for the garden. Open galleries (*lang-fang* or *lang-tzu*), which follow the sinuous contours of the garden and edges of the pools and connect the various buildings, may take the form of a veranda, corridor, or portico in front of the main room

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

(*ta-t'ing*) of the house. Emphasizing the architectural character of the garden, with its pavilions and galleries, is the *ch'êng*, or garden wall, which follows the contours of the terrain; only on rare occasions is a wall built on a straight line, as in the Garden of the Jade Fountain near Peking and in the New Summer Palace of that city. Openings in the walls give access to the garden and are generally octagonal or circular, without doors or gates; rarely are they rectangular. One of the most famous of the circular type is the so-called "moon opening," in which the garden appears to be reflected, as in a mirror. Particularly decorative elements in Chinese landscape architecture are the bridges that connect the mainland to the islands and rocks in the lakes. A typical bridge is built of stone in the form of an arc that is decorated with a balustrade surmonted by small pillars. Other types are level, following a zigzag course that breaks the straight line of the walks. Wading stones are placed in shallow water and along the towpaths.

The traditions of Chinese landscape architecture are so ancient that it is almost impossible to make an adequate historical survey of the subject. The *Shih-ching* ("Book of Odes or Songs") contains vague references to terraces, pools, and gardens but gives no details as to their design or type. From the Ch'in (221–206 B.C.) and Han (206 B.C.–A.D. 221) dynasties we have references to pavilions, bridges, and galleries built around the palace-cities, but these references are not sufficiently detailed to convey any clear idea of the principles of landscape architecture of these periods. Under the Liu Sung dynasty in Nanking (420–79), the first formal elements of landscape architecture (e.g., pavilions, stone blocks, pools, and trees) seem to have made their earliest appearance. They correspond to the Taoist philosophical principles that attempted to lead man back to a deeper spiritual and material contact with nature. These theories were more clearly expressed in 4th- and 5th-century Buddhism, especially in the pantheistic philosphy of Ch'an Buddhism.

Toward the end of the T'ang dynasty (618–906), many gardens were laid out according to Taoist theories regarding the achievement of immortality. During the Five Dynasties (907–60) gardening activity was concentrated in the cultivation of flowers. During the Sung dynasty (960–1279) Chinese landscape architecture reached a peak of natural perfection that was never equaled in any other era. In the period of the Yüan dynasty (1260–1368) the representation of nature lost the formal perfection of the previous period and assumed romantic aspects. From the Ming dynasty (1368–1644) to the present day, the relationship of the garden to nature has been manifested in highly realistic scenic representation (FIGS. 1079, 1080).

Japan. Japanese landscape architecture is an expression of a profound love of nature and the desire to be in constant synthesis with nature in all its living aspects. The Japanese call this *mono-no-aware*. The peculiar characteristics of Japanese gardens set them completely apart from all other types of gardens. The landscape architecture of Japan differs even from that of China, which contributed the first compositional elements, subsequently adapted according to Japanese taste and national character. In Japan there is no attempt to create a faithful reproduction of nature. The landscape architect is an artist who tries to express his own personality, discarding what he considers useless and emphasizing those elements that he believes will find favor with the spectator.

The observance of conventional rules in this art is intended to evoke the feeling of living in the midst of natural surroundings. The aim of the architect is to create a weathered and antique look (*sabi*), achieved by covering stones and tree trunks with moss, allowing wood and stone to become corroded, and permitting all metal work to become oxidized (PLS. 448, 449). Water, in the form of pools, lakes, streams, or waterfalls, is an essential element for the achievement of a natural aspect to the garden. It evokes the landscape of the seashore or mountains, where turbulent streams and waterfalls abound. The two Japanese terms that denote a garden are *sensui* (pool and water) and *rinsen* (water and wood). The latter term refers to trees, another essential element in Japanese gardens.

The cycle of seasons is symbolized by numerous plants

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

and trees such as conifers, broad-leaved evergreens, and deciduous species. Among the conifers the *akamatsu* (*Pinus densiflora*) is preferred. The most admired broad-leaved evergreens are the *mochi* (*Ilex integra*) and *mokkoku* (*Ternstroemia japonica*). Deciduous trees are not so highly regarded; they are considered beautiful only in the spring, when they come into leaf and blossom, and in the autumn, when their leaves turn (*momiji*, autumn leaves). Shrubs, either evergreen or deciduous, complete the botanical element of the garden. Among these the conifers are preferred, but flowering bushes such as azaleas and bushes with yellow or reddish leaves are also planted.

A further indispensible element to complete the natural aspect of the garden is stone. Stones are placed along the water courses, which represent streams, or on the banks of the artificial pools, which represent either lakes or oceans. They are placed so as to suggest a natural landscape. Traditionally rocks or stones used in connection with water are gathered from the seacoast; stones used for "mountain" effects are obtained from the mountains.

No trace of affectation is allowed to appear in Japanese gardens. This has led to the creation of precise rules governing landscape architecture and to esthetic principles regarding the forms and proportions of the decorative elements. A pool or lake is the most common form of the water element. Its source must always be within sight, either as a waterfall or a fountain. In terrains that do not permit the building of a pool, the water is made to flow as a stream. Lakes must have an irregular outline with bays, promontories, and small tortoise-shaped islets planted with trees, preferably dwarf pines. The islets are often connected to the mainland by bridges. The lake or pool must always be at the center of the garden, surrounded by a circle of trees and "mountains." Waterfalls must be placed in the hilly part of the garden, to the left of the viewing point, so that the water flows from left to right. This left-right movement is required for esthetic reasons and is also derived from very ancient Chinese beliefs based on occult directional principles. The directional emphasis on the left also governs the placement of the other scenic elements such as trees and rocks. As a rule, the dominating elements are placed at the apexes of a scalene triangle whose shortest side is on the left and longest side faces the main house. The most important scenic element (such as a waterfall) is placed at the apex farthest from the base. This plan provides the greatest possible perspective depth to the whole design.

The stones are placed according to three systems of grouping: artificial (*ishi-gumi*), Chinese, and freely scattered (*suteishi*). In the first system the stones are used to complete the scenic elements of the landscape — lake, brook, hill, and so forth. The second, or Chinese, system involves the cementing together of various stones into a desired shape; this method is not highly regarded. The third system tends to avoid any possible trace of stiffness that could be detrimental to the natural outlines of the garden, the stones being scattered singly and at random on the ground.

Special techniques apply to the placing of trees as well as stones. These techniques govern the choice of species, the manner of planting, and — since Japanese gardens represent a miniature of nature — the special cultivation of dwarf types. Dwarf trees are obtained by a process called *zundo*: the top of the tree is repeatedly pruned, preventing it from growing vertically and forcing it to spread laterally. This system, not unique by any means, originated during the Edo (or Tokugawa) period. It is used most frequently in gardens where the tea ceremony is held.

A cardinal principle of Japanese landscape architecture is that every garden must be delineated and isolated from the surrounding countryside by a wall. Often, however, a line of trees or a grove of bamboos is considered sufficient for this purpose. One characteristic peculiar to Japanese gardens, and one which is most striking to Western eyes, is the complete absence of lawn in the empty spaces of the terrain. In keeping with the concept of a representation of nature, these spaces are covered with azalea bushes or dwarf plants. Moss is used in shaded areas. In classic gardens, especially where the terrain is flat, it was the custom to spread white sand mixed with pebbles on the ground. This was then raked with the greatest care, leaving the traces of the raking tool on the surface (PL. 448).

Special techniques have also been devised for the stone lanterns (*tōrō*; PL. 448) and for the small bridges connecting the islets to the mainland. The bridges are made either from a single stone slab or in curved sections joined together. Special methods are also used to trace the footpaths that run between the various buildings so that visitors can walk around the lake.

Japanese gardens are generally classified as hill gardens (*tsukiyama*) or level gardens (*hiraniwa*). The former contain hills and a lake; the latter are built on flat terrain with sand, stones, trees, lanterns, and wells. Both garden types can be laid out in three different styles: *shin*, *gyō*, and *sō*. The first requires a large space and must contain all the prescribed scenic elements. It is the most elaborate style, ceremonial and severe in aspect. In the *gyō* style, details are less important and the design is not so formal; the rigid symmetry of the *shin* style is lacking. The third style allows free rein to the fantasy of the landscape architect. In aspect it is asymmetric and restful.

Hill or level gardens in any of the three styles can assume three different forms: simple, continuous, or composite. For gardens of small area the simple form is preferred. The composition is arranged as in a painting, so that the whole garden can be seen from a single viewpoint. If the plot is long and narrow, a continuous landscape is constructed (*roji-niwa*, transitional garden), and the visitor must traverse the entire length of the garden in order to appreciate it. A changing series of views is obtained by dividing the garden into two sections, outer and inner; the connecting path is bordered with stone lamps and ornamental stones. The tea garden is a typical examples of the continuous garden form. For large gardens the composite form is used. A succession of panoramas is constructed, each with a different landscape, in the manner of the painted scrolls (*emakimono*); the pictorial story is unfolded, scene by scene, to the end of the tale.

There are also certain specialized forms of gardens, including miniature gardens on trays (*bonkei*), which are made of mud, peat, and sand of various colors; landscapes of stone and sand on black lacquered trays (*bonseki*); and miniature trees in pots (*bonsai*).

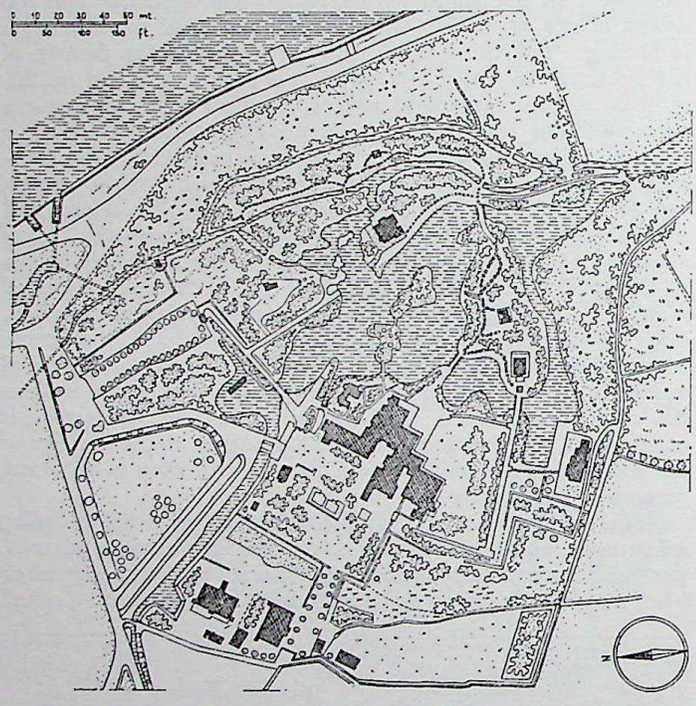
The art of landscape architecture was introduced into Japan about the middle of the 6th century, but it has not been possible to determine the precise date. The first notions of landscape architecture in Japan were a result of the introduction of Buddhism, which reached the country from China, via Korea. The style was that of China of the Han and Six Dynasties (3d cent. B.C.–6th cent. of our era), a style which flourished through the Asuka (552–644) and Nara (645–793) periods, when the capital was at Nara. In the period that followed the transfer of the capital to Kyoto (794), a smaller type of garden (*senzai*, cultivated courtyard), purely Japanese in style, was developed alongside the larger Chinese garden.

When the feudal wars broke out, the Buddhist priests preserved the art of landscape architecture by constructing splendid gardens in their monasteries. At the beginning of the 13th century the Chinese Buddhist Zen philosophy (Chin., Ch'an) was introduced into Japan. Zen aimed at the union of the individual



Kyoto, Katsura palace, plan of the garden.

with nature, inspiring a taste for simplicity and serenity. This caused a revolution in landscape architecture and led to the creation of the ceremonial tea garden (*cha-no-yu*). Even today it is possible to admire the vestiges of the gardens of this period (FIG. 1082) in the Shōmyōji at Kanazawa, near Yokohama, and in the Kenchōji at Kamakura.

During the Muromachi (or Ashikaga) period (1334–1573), gardens began to take on the characteristics of the lake-island and level garden types. Good examples of this period still visible today are the Tenryūji garden in the suburbs of Kyoto, creation of the Buddhist priest and calligrapher Soseki (Musō Kokushi; 1275–1351); the Kitayama garden near Kyoto, laid out by the shogun Yoshimitsu (1397), which forms part of the Rokuonji (better known as Kinkakuji); and the level garden of the Ryūanji, designed by Sōami (q.v.; PL. 448; FIG. 1082).

During the Momoyama period (1573–1615) the tea garden was further developed, as were the two garden types of the previous period. Momoyama landscape architecture avoided every trace of artificiality. Characteristic of this period are the paths made of stones laid down at a certain distance from one another (*tobiishi*), as in the Myōkian garden near Kyoto, built in 1582 by Sen-no-Rikyū. After the rise of the Tokugawa shoguns in 1603 and the transfer of the capital to Edo (now Tokyo), gardens of the lake-island type were built in ever-increasing numbers and size and assumed the character of composite landscapes. A famous example from this period is the garden of Katsura palace, southwest of Kyoto, created by Kobori Enshū (1579–1647; FIG. 1083).

When Japan was opened to Western contacts in 1868, landscape architecture was subjected to new influences. This state of affairs lasted but a short time, since these influences were contrary to Japanese taste. During the 19th century, however, a new type of garden was developed, known as the *bunjin-shiki* (garden of the man of letters). The design of the *bunjin-shiki* allows the landscape architect to express his ideas in a very free and independent manner.

Antonio PRIORI

PRIMITIVE CIVILIZATIONS AND PRE-COLUMBIAN AMERICA. The cultivation of plants and flowers for ornamental purposes is rare in primitive cultures. In only a few places (Tahiti, Benin, the interior of New Guinea) are sacred areas, communal houses, and dwellings of chiefs surrounded by ornamental plantations. Detailed information on this subject is very limited.

Better documentary evidence exists, however, concerning gardens in the Aztec civilization of pre-Columbian Mexico and the Inca empire in Peru, contained in the descriptions of ancient chroniclers and early travelers. In the Aztec cities every house had an inner courtyard where flowering plants were cultivated. Suburban houses were surrounded by gardens planted with flowers and vegetables. Terraced gardens with flowers and green plants decorated the palaces of chiefs and high dignitaries. The love of flowers among the Aztecs is documented in their art. Three of the deities of their pantheon — Xochiquetzal, Xochipilli, and Macuilxochitl — presided over the cultivation of flowers. At Oaxtepec there was a nursery garden for tropical plants, and at Xochimilco, on the outskirts of modern Mexico City, there was a magnificent public garden.

King Nezahualcoyotl is remembered for his beautiful gardens. The most remarkable were those at Texcoco and Tezcotzinco, which contained numerous fountains, pools, and water courses, filled with many varieties of fish. Multicolored birds nested on the branches of the trees; the records speak of more than two thousand pines. A section of these gardens was laid out as a labyrinth in the center of which, carved in the living rock, was the sovereign's bath, where he received and entertained important guests. Statues, kiosks, and temples of beautiful design filled all these grandiose Aztec parks. At Tezcotzinco the structures were laid out in terraces. A great variety of plants and flowers were cultivated, some brought from far-off places.

In ancient Peru the chronicles tell of a "golden garden" near the Coricancha (golden enclosure, or Temple of the Sun), the greatest sanctuary in Cuzco. This garden was said to contain golden plants among which grazed herds of llamas all of gold, tended by shepherds of gold and silver — a sculptural representation possibly inspired by a royal garden. On the island of Titicaca in Lake Titicaca, E. G. Squier noted that the so-called "Palace of the Incas" was surrounded by an architectural garden built on terraces connected by stairs.

Ernesta CERULLI

THE WEST. *The Middle Ages.* The gardens and monuments of the Roman Empire, including its distant provinces, were destroyed by repeated barbarian invasions. By the early Middle Ages, gardens were probably restricted to narrow confines such as those of a monastery cloister (PL. 426). Medieval gardens consisted of small walks and flower beds radiating from the edge of a central well, around which grew stately cypresses. Secular gardens, within castle enclosures, cannot have been very different.

Considerable source material is available on Gothic landscape architecture. Miniatures, paintings (VI, PL. 345), tapestries, and to a lesser extent frescoes (PL. 427) enable us to reconstruct partially the main outlines of the Gothic garden. Two literary documents contain descriptions of gardens of this period: the eighth chapter of the *Liber ruralium commodorum* by Pietro de' Crescenzi of Bologna (ca. 1305), translated into Italian, English, French, and German in the 14th and 15th centuries; and the "Proem to the Third Day" from Boccaccio's *Decameron*. The *Amorosa Visione* by Boccaccio also describes

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

the great garden of the Castel Nuovo in Naples, which lay between the palace of King Charles of Anjou and the sea. Describing life in the 14th century, Folgore da San Gimignano wrote in his sonnet "Domenica Die": "Youths dance, knights joust — seeking adventure in every district — in the squares, gardens, and orchards." Boccaccio furnishes us with a detailed description of a garden-orchard, stating that the layout was geometric; spacious and straight walks radiated outward from the center. The walks were covered with arbors of grape vines, and their sides were almost completely enclosed with hedges of jasmine and white and red roses. Rectangular and triangular beds, formed by intersecting walks running parallel to the perimeter and diagonally across the garden, were filled with so many fragrant plants that "to describe them all would take too long." In the center of the garden was a closely mown lawn of fine grass, of such a dark green it seemed almost black. The lawn was colored by nearly a thousand different varieties of flowers and was enclosed by a border of bright green and brilliantly hued oranges and citrons. In the middle of the lawn stood a magnificently carved white marble fountain. A figure supported by a column in the center of the basin threw a jet of clear water high into the air, which fell back into the pool with a pleasant sound. The water then flowed through a hidden conduit under the lawn and reemerged to flow through skillfully constructed canals all around the garden.

Pietro de' Crescenzi noted the indigenous varieties of flowers in 14th-century gardens: flag irises, lilies, roses, and violets, as well as lilacs, hyacinths, and jasmine — the species brought to the West by crusaders and merchants. Next to the garden was a grove of ornamental trees: laurels, cedars, olives, pines, and cypresses; and beyond this an orchard laid out on a strictly geometric but simple plan. A typically Gothic detail, often depicted in miniatures, was an aviary large enough to contain one or more trees where birds could roost. An illustration in the 15th-century *Liber de sphaera* (Modena, Bib. Estense) and representations of the fountains of youth (PL. 427) are excellent examples of the types of fountains that were obligatory in every garden. The *Madonna in the Rose Garden* by Stefano da Zevio (I, PL. 380; VI, PL. 372) faithfully depicts an arbor-covered walk which surrounds the garden. Similar walks can be seen in the miniature of *St. Anne and the Three Marys* in Fouquet's *Heures d'Étienne Chevalier* (Chantilly, Mus. Condé). The clear-cut division of the landscape by a high enclosing wall is a very typical characteristic of Gothic landscape architecture, and more than one example of this can be found in the famous miniatures of the *Très Riches Heures* of the Duc de Berry (Chantilly, Mus. Condé). In the later Middle Ages gardens became richer, softer in outline, and more sensuous, although they maintained the layout and spirit of the cloister.

Roberto CARITÀ

Material evidence of Byzantine landscape architecture is lacking. However, it is possible to reconstruct in general outline the appearance of Byzantine gardens on the basis of miniatures, historical documents, and a few mosaics (PL. 426). Close contacts between the eastern Roman Empire and Persia during the Sassanian period (ca. 300–650) undoubtedly contributed to the spread within the Byzantine world of a Persian style of landscape architecture particularly well suited to a terrain and climate requiring shelter during the hot season. Large plants and fountains must have been fundamental elements. A mosaic in the Great Palace of the Emperors at Constantinople — probably 5th or 6th century — depicts trees and a pool fed by running water, set among architectural constructions. According to Theophanes (K. de Boor, ed., *Theophanes chronographia*, Leipzig, 1883–85), the walls of Constantinople were bordered with gardens. The *Chronicon paschale* tells us that the summer palace of the Emperors was set amid gardens and terraces and was connected to the imperial palace by galleries and groves of trees.

From Theophanes we also learn that Emperor Basil the Macedonian (d. 886) ordered the Tzykanisterion (playing field for a ball game on horseback similar to polo, derived from the Persians) to be demolished in order to build a larger one. In its place there rose the Nea Moni (New Church), connected with the new Tzykanisterion by two galleries; between them a shaded garden with trees and fountains was constructed.

Private dwellings were provided with gardens of varying sizes. Generally a house was fronted by a courtyard with a well; baths sometimes opened onto the garden.

One of the last descriptions of Byzantine landscape architecture was written by Theodore Metochites, lieutenant of the emperor Andronicus II Palaeologus (1282–1328). He described his own palace, unfortunately destroyed in 1328, and the delightful gardens and ornamental water works surrounding it.

Byzantine art — religious and nonrealistic in character — can only offer an approximate idea of the actual appearance of Byzantine gardens. The illuminations found in the homily books and a few mosaics (e.g., late 11th cent., *The Annunciation to Joachim and Anna*, Catholicon, Daphne, Greece; II, PL. 449) depict fountains in the form of "fountains of life," which have a Christian significance. Such fountains, probably traditional in Byzantine gardens, consisted of several superimposed basins surmounted by a cone-shaped urn from which flowed the water; a structure of this type is known to have existed in the Great Palace.

* *

Renaissance and baroque periods. During the 15th century the naturalistic character of medieval landscape architecture made way for a new architectonic concept. This concept had a tenuous and indirect link with the classical Roman period based on literary sources (often fanciful) and a few figural sources that were rarely more than backgrounds for pictorial representations. Certain ancient elements were revived, however, particularly the *opus topiarium* and the planting of trees in quincuncial arrangement. These and other elements gave the 15th-century garden an antinaturalistic, rational, and geometric character. The arboreal arrangement was not the only one subjected to mathematical treatment; every form was given an artificial shape — cube, sphere, pyramid, and so forth. The spatial aspect of the garden resulted from a series of calculated linear and volumetric effects.

The transition from a Gothic to a Humanistic concept of landscape architecture was slow and gradual. To a certain extent it was determined by the change in the character of the urban centers. When the fortress city, dominated by the strongholds of the nobles, was freed from the limitations of its encircling walls, residential villas were erected in the surrounding open countryside. Whereas previously a garden had been considered a necessary but circumscribed ornament, now in the spacious surroundings of these suburban villas, landscape architecture assumed new forms; in the succeeding century they were to develop in a very striking fashion. Although it is difficult to establish precise chronology, the specific style of 15th-century landscape architecture probably lasted for only a few decades, reaching a high point of perfection in the second half of the century. The new forms were developed first in Tuscany and central Italy (where Alberti and Francesco di Giorgio laid down the constructional norms) and almost contemporaneously in parts of northern Italy (Ferrara, Bologna, Mantua, Pavia) and in the south (Naples). These new forms were seen in the great villas of the Medici, Montefeltro, Este, and Visconti families and in the villas of the Aragonese kings of Naples.

Many of the greatest architects of the period turned to landscape architecture: Alberti, Rossellino, Giuliano da Maiano, Michelozzo [the Medici villas in Careggi (1433), Cafaggiolo (1451), and Fiesole (1458–61); Castello di Trebbio, ca. 1461], and Giuliano da Sangallo (Villa of Poggio a Caiano, 1480–85; PL. 428). None of these 15th-century gardens now exists in its original form; all were subsequently redesigned and altered by mannerist and baroque architects. We can form an idea of the actual appearance of the gardens of this period only from literary sources and from a number of paintings. The *Hypnerotomachia Poliphili* (Venice, 1499) is a very important documentary source, containing an imaginary description of the Garden of Venus on the island of Cythera. All the elements

Rome, Villa Giulia, plan and longitudinal section of the original layout (*from P. Letarouilly, Edifices de Rome moderne, Paris, 1868–74*).

which other writers of treatises had only indicated fragmentarily, or which artists had used as backgrounds for their paintings and frescoes, are dealt with here in considerable detail. This mythical garden is laid out on a circular plan radiating from the fountain of Venus, which rises in the center of an amphitheater surrounded by a mosaic walk. The garden spreads out in ever-widening concentric circles of canals, topiary work of shrubs, flower beds, and lawns. The arboreal element, such as box trees trimmed in geometric patterns and even sculptural groups, alternates with the architectural element, represented by peristyles and marble gates, which are rendered live with creeping plants. The entire garden is enclosed by a ring of cypresses and of myrtle trees pruned to imitate a wall.

The *Zibaldone* of G. Rucellai describes a 15th-century garden that actually existed at Quaracchi, near Peretola, Tuscany. It is believed that Alberti may have collaborated in its design. The quantity and variety of trees with which the garden was adorned were remarkable; some — the sycamore, for example — were very rare at that time. More important, however, was the essentially architectonic character of the design, achieved by a geometric treatment of the various elements and by a logical layout which deepened the perspectives. Fanciful effects were also obtained, such as labyrinths, which set a fashion so widely followed in the gardens of the 16th century. Less importance seems to have been attached to the spatial relation between the buildings and the gardens, and between the gardens and the natural surroundings. A study of the literary and figural sources of the period shows that much stress was placed on the enclosure of the garden by a wall or by a screen of trees. This suggests that the 15th-century landscape architects, although opening the way for the magnificent and elaborate gardens of the 16th century, had not yet completely abandoned the medieval concept of the *hortus conclusus*.

The earliest important example of 16th-century landscape architecture was the grandiose project of Bramante (begun 1505) to connect the Vatican Palace with the small villa on the Belvedere hill, commissioned by Pope Julius II. The distance between the two buildings was approximately 950 ft., with a rise of about 65 ft. (The slope, however, was not even; there was a slight depression running across the ground that had to be filled in before the work could begin.) Little of Bramante's original design exists today; only the general outlines survived the alterations made by later architects. During the pontificate of Sixtus V (1585–90), Domenico Fontana divided the area in two with the wing of the library; and in 1817–22 the upper half was further divided by the construction of the Braccio Nuovo. Other portions were also substantially modified, especially the great exedra at the upper (Belvedere) end, over which Pirro Ligorio added a half-bowl-shaped vault and a loggia.

The best illustrations now extant of Bramante's original plan can be found in a rare drawing by G. A. Dosio (Uffizi, Florence) and in a painting by an unknown artist in the Kunsthistorisches Museum in Vienna. Bramante planned an absolutely new type of garden in which the architectural element clearly predominated over the arboreal. The latter element, however, was important in providing color. Bramante overcame the unevenness of the terrain by means of a geometric progression of three levels, the lowest of which is now the Cortile del Belvedere (not to be confused with the small octagonal internal courtyard of the same name in the Belvedere pavilion at the north end, built by Innocent VIII). Bramante's middle terrace is now mostly occupied by Fontana's library and the Braccio Nuovo; the space between them is known as the Cortile della Biblioteca. The upper level is the present Cortile della Pigna. The horizontal terraces were laid out with grass and flower beds, their mass articulated by the steep flights of steps between levels (each approximately 30 ft. high) and by the shadows cast by the surrounding buildings. (The longitudinal axis of the garden ran from south to north.) Despite strong contrasts of light and shade, the whole design must have achieved a feeling of continuity by means of a succession of ascending stairways, a series of connecting fountains along the central longitudinal axis, and, above all, by two niches, or exedrae — a smaller one in the center and the other, at the far upper end, very large and incorporated into an impressive edifice with a double order of columns (II, FIG. 605). By these

UP State Museum, Lucknow

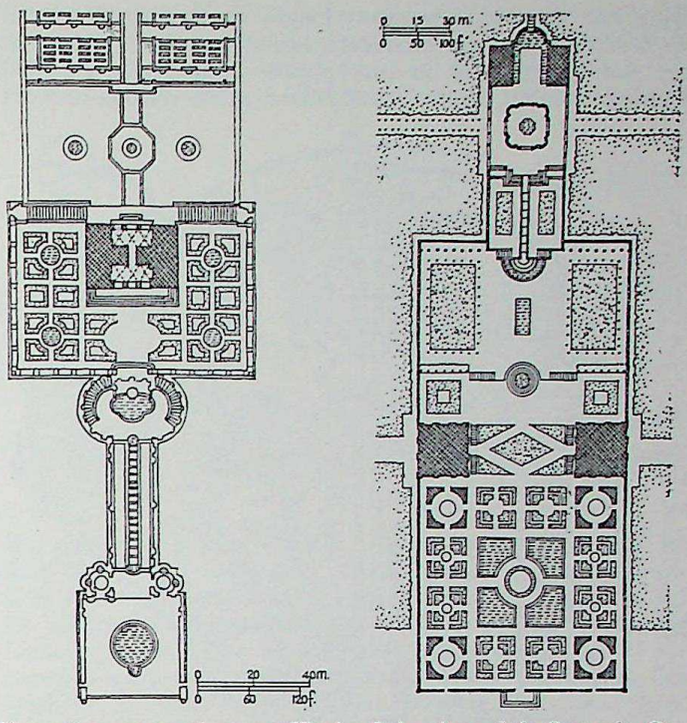
1089

means the strongly defined dividing line created a perspective effect (as seen from the lower, or Vatican, end) of yet another terrace based on what was actually the second story of the upper building. Such an architectonic solution seemed to use the very arch of the sky as its logical conclusion. Perspective was heightened by the fact that the flanking buildings had a diminishing series of orders — the lowest with three, the middle with two, and the upper with a single order.

Bramante's conception, integrated with the original creations of other great architects (Raphael; A. da Sangallo; Vignola; Ligorio and Peruzzi, PL. 429; and Tribolo), became the basis of Italian landscape architecture. Raphael designed the plans (ca. 1516–17) for a villa (now Villa Madama) for Cardinal Giulio de Medici, later modified by A. da Sangallo. Although the villa was never completed, what remains of it today is fascinating, even if a feature considered fundamental by Raphael — its ideal relationship to the melancholy solitude of the surrounding countryside — no longer exists. While Bramante had conceived a purely architectonic garden, Raphael, the better to be in harmony with the georgic peace of the Roman countryside, surrounded the building with spacious planted gardens carefully laid out along geometric lines. Sangallo added a nymphaeum, elaborating with great originality an architectural theme derived from classical antiquity. The nymphaeum was destined to become an almost obligatory decoration in later gardens, since by this means water could be used ornamentally in the most fanciful ways. The two small rustic grottoes in the nymphaeum of the Villa Madama already existed in 1522 and are probably the first of this kind of architectural detail. (The one designed by Tribolo for the Villa di Castello of the Medici, near Florence, formerly believed to have been the first example, dates only from about 1545; PL. 431.)

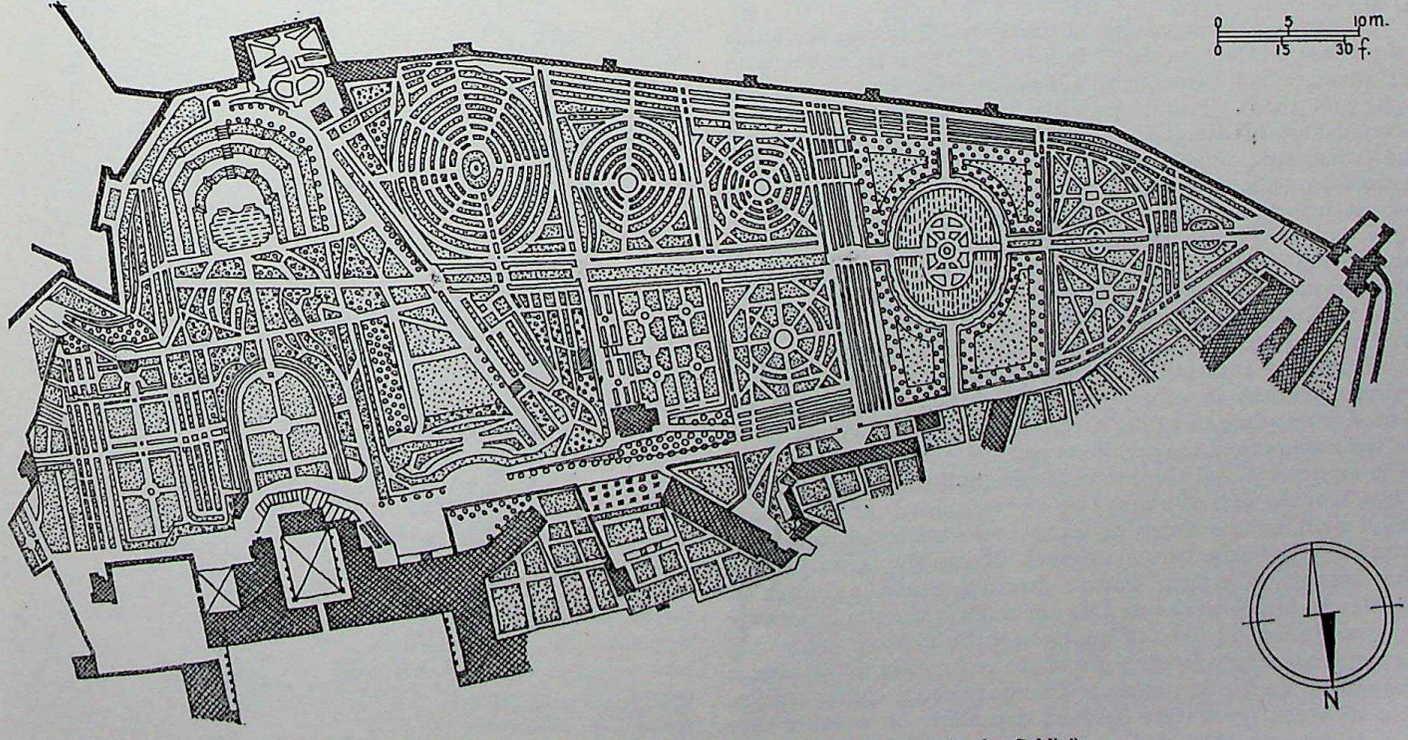
Garden design rapidly became one of the most diffused and significant expressions of 16th-century architecture, and many famous architects followed in the footsteps of Bramante and Raphael. Among the first was Peruzzi, who laid out the Villa Farnesina in 1508–11. Vignola designed the Villa Giulia in 1551–53 (FIG. 1087), the gardens of the Palazzo Farnese in Caprarola in 1559 (FIG. 1090), and the Villa Lante at Bagnaia, famous for its ornamental water works, finished in 1588 (PL. 433; FIG. 1090). On the Palatine, Vignola also built the Orti Farnesiani, now vanished save for the gate, which has recently been reerected at the eastern base of the hill. In 1544 Giovanni Lippi designed the Villa Medici in Rome (formerly attributed to his son Annibale). Between 1500 and 1600 the town



Sixteenth-century gardens near Viterbo, Italy, plans. *Left*: Caprarola, Casino and garden of Palazzo Farnese. *Right*: Bagnaia, Villa Lante, after an 18th-century engraving.

of Frascati became a center of princely villas and gardens: The magnificent Villa Falconieri was begun in 1545, followed by the Villa Mondragone, the Villa Aldobrandini (laid out by Giacomo della Porta; PL. 433), and others in 1598–1609. The series culminates in Maderno's masterpiece, the 17th-century water theater of the Villa Ludovisi (later Conti, now Torlonia). Great Imperial ruins, particularly in Rome, sometimes became the curious and majestic foundations for gardens, as did the Mausoleum of Augustus.

The vast complex of the Villa d'Este at Tivoli, built with amazing speed by Ligorio between 1550 and 1569, has fortunately come down to us without substantial modification, as can be seen from an aerial view engraved by Etienne du Pérac in 1573 (PL. 432). Ligorio basically followed Bramante's scheme,

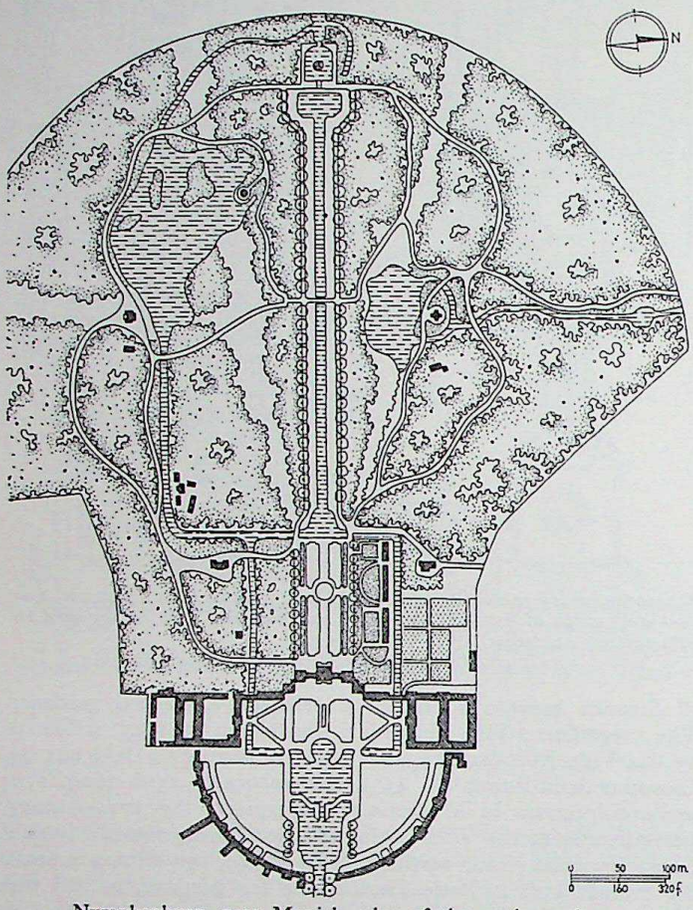


Florence, Boboli Gardens in the 18th century, plan (*from an engraving by Soldini*).

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

laying out a series of terraces along a clearly defined central axis leading to the monumental mass of the villa. Though it may not be apparent at first glance, Ligorio also followed Raphael's concept for the Villa Madama in the relation between



Nymphenburg, near Munich, plan of the castle gardens.

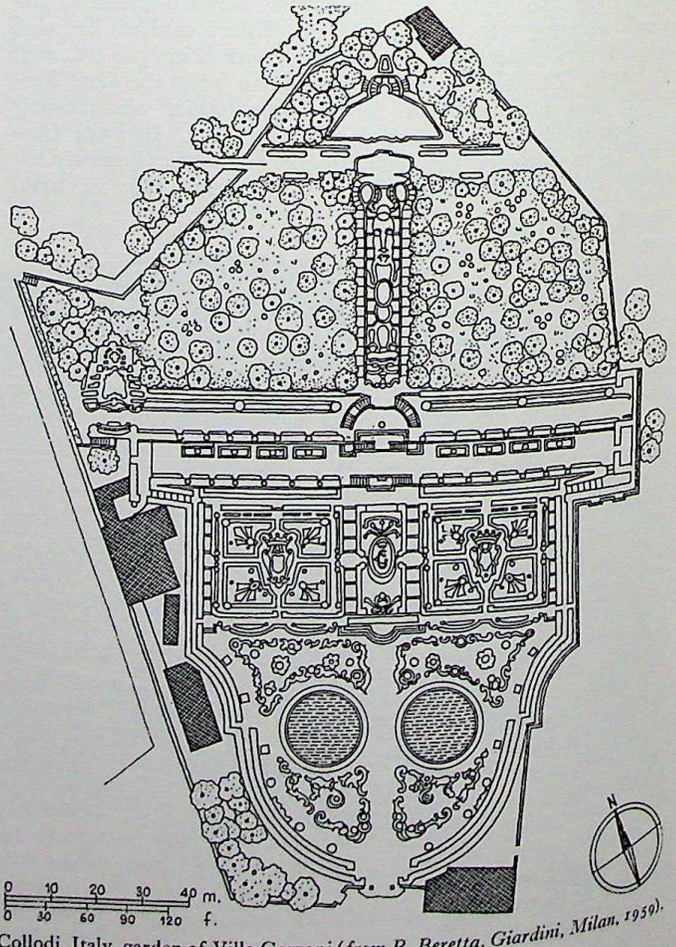
the architecture of the villa and the planted landscaped garden. At the Villa d'Este a very plentiful water supply was used for decorative purposes as much as were trees, plants, and flowers (IX, PL. 313).

A worthy Tuscan version of the Villa d'Este was the series of gardens laid out on the Boboli hill in Florence, at the base of which stood Brunelleschi's Palazzo Pitti (PLS. 429, 430, 431; FIG. 1089). Tribolo prepared the designs and began the work before his death in 1550. He was probably succeeded by Ammanati. Buontalenti, sometimes mentioned as Tribolo's successor, built only the Grotto where Michelangelo's figures of the prisoners were to have been placed in 1576 (PL. 430). The sculpture which Ammanati grouped around the fountains and in the grottoes assumed fantastic forms that blended with the surrounding landscape, as is also the case with the *Appennino* of Giambologna in the Villa Demidoff at Pratolino (PL. 430) and in the park of the Palazzo Orsini at Bomarzo (X, PL. 137).

Mannerist landscape architects devised a number of admirable gardens in other parts of Italy, and their character varied from place to place, depending on the individual tastes of the owners (and the architect) and the nature of the terrain. The immense Royal Garden in Turin, built between 1560 and 1630, was the first of a series in a beautiful belt of castles and villas built by the dukes of Savoy, who were determined to turn the city into a baroque capital. It was the Royal Garden that inspired Torquato Tasso's description of the Garden of Armida in his *Gerusalemme Liberata* and was the site of a battle in 1706 during the War of the Spanish Succession; today only its memory remains in the form of the etchings in the *Theatrum Sabaudiae*. In Venice, gardens assumed special characteristics. Two different types were devised, depending on whether they were laid out within the confined spaces of the city on the lagoon, or in the unlimited areas surrounding the villas on the mainland. The layout of the mainland villas followed a pattern that remained in use until the 18th century. Here the natural elements predominated over the architectural, even though the general plan followed the Italian style based on a central axis of stairways or avenues (PLS. 434, 435). Among the other noteworthy Renaissance gardens in Italy were the Villa dell'Imperiale at Pesaro, commissioned by Alessandro Sforza shortly after 1450, and the Palazzo del Te at Mantua, built by Giulio Romano in 1525–35 (PL. 428).

During the 17th century landscape architecture all over Europe remained under the influence of the Italian style. It is as difficult to arrive at exact chronological or stylistic dividing lines between mannerist and baroque landscape architecture as it is for the other arts. Until the great creations of Le Nôtre (q.v.), landscape architects continued to develop and expand 16th-century Italian models. Nevertheless, the landscape architecture of the late 17th century differs considerably from that of the early part of the century and is the forerunner of the architectonic style of the 18th century. A predominant characteristic of the baroque garden was the stress placed on the size and extent of the arboreal element. A tendency toward the picturesque developed during the 17th century and was expressed by an increasing use of large numbers of plants and a greater complexity and variety of structural details. There was also a growing use of color and light, and architects sought to create smoother transitions from one area of the garden to another. Sculpture, often in the form of monumental masses that were surrounded by water, was frequently employed to heighten the architectural effects of the earlier forms.

The 17th century brought many changes to the great villas at Frascati (see above) and added to their number the previously mentioned Villa Ludovisi. A complete list of 17th-century gardens in Europe would be long indeed. Rome, however, maintained a lead, with the new (or renovated) Vatican Gardens and the gardens of the princely palaces and villas. It is not easy to attribute a definite architect or date to every garden,



Collodi, Italy, garden of Villa Garzoni (*from R. Beretta, Giardini, Milan, 1959*).

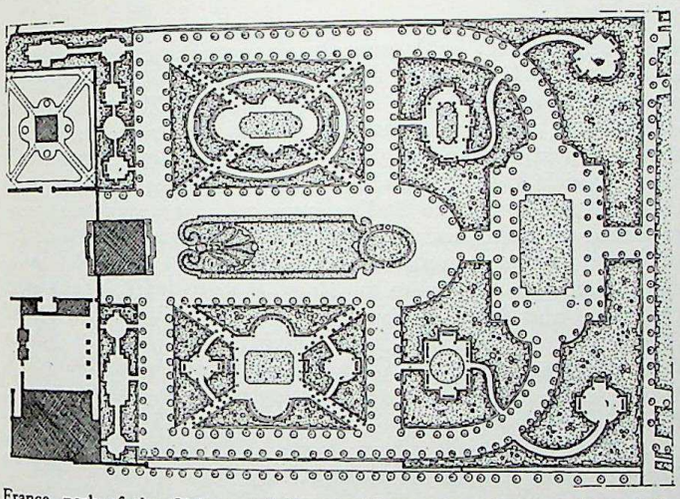
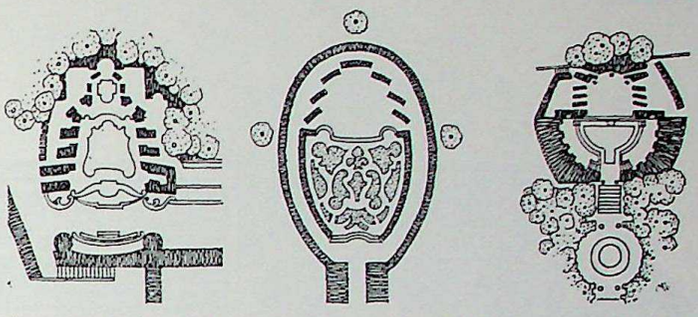
since landscape architecture, of all the forms of architecture, is most easily subjected to stylistic changes. The aspect of a garden hardly ever remains faithful to its original design, and its date can only be approximately set within the span of a century. Certain gardens, in fact, can be cited as examples of the evolution of landscape architecture through three centuries, from the Renaissance through the mannerist, baroque, and rococo, graphic documentation being fairly plentiful for the more important gardens. The gardens of the Palazzo Colonna on the Quirinal illustrate this evolution. They are mentioned by Francesco Albertini in 1510, and were repeatedly altered until the middle of the 18th century. The garden of the Palazzo Barberini, on the other hand, is definitely known to have been laid out in the middle of the 17th century. The powerful and ambitious Barberinis also laid out another garden around their villa on the Janiculum. The gardens of the Altieri palace and villa, as well as those of the Villa Aldobrandini (PL. 433), were famous for their wealth of antique sculptures and obelisks. Other important Roman villas included the Rospigliosi villa on the Quirinal; the Giustiniani villas, one near the Lateran and another on the Via Flaminia, the latter now incorporated in the Borghese Gardens; and the Odescalchi villa on the Via Flaminia. The garden of the Villa del Vascello (originally Villa



France, park of the Château of Fontainebleau, plan of the garden of the Marquise de Pompadour.

Benedetta) was the only known creation of two architects, Basilio and Plautilla Bricci. It was the scene of a furious battle and was totally destroyed in 1849. Also on the Janiculum was the splendid garden of Villa Doria-Pamphili, designed by Algardi after 1650. The original layout has been altered beyond recognition. Only its enormous area (a circumference of more than 8 miles) remains unchanged as the largest of all Roman gardens from the days of Innocent X.

In Florence, A. Novelli and L. Fantini created a baroque garden in the Orti Oricellari, while G. Silvani designed several villas, of which the Villa Corsini was the most important. Other fine gardens were those of the Villa Garzoni at Collodi, near Lucca (FIG. 1092), laid out in 1650; Poggio Imperiale, the masterpiece of G. Parigi, in 1622; and several near Siena. Splendid villas and fine gardens were designed in other parts of Italy, both north and south, during the 17th century. In Lombardy, Palazzo Borromeo (begun 1622 by Carlo Borromeo, finished 1671) on Isola Bella in Lake Maggiore was the creation of a group of collaborating artists including A. Crivelli, F. M. Ricchino, and C. Fontana (PL. 440). In Piedmont the dukes of Savoy, followed by almost all the nobility, owned splendid gardens. Emmanuel Philibert commissioned the Royal Garden and the small but graceful garden of the Old Royal Palace (enlarged and altered by Le Nôtre, 1698–1700). The *vigna* of Cardinal Maurizio (later Villa della Regina) was designed and laid out by Ascanio Vitozzi in 1616, the *vigna* of Madama Reale (Marie Christine) in 1648–63 by A. Costaguta. A magnificent garden was built at Venaria Reale, near Turin; the design was the work of A. di Castellamonte. Construction continued for several decades, until the French army of Marshall Catinat destroyed everything beyond repair in 1693, during the War of the Spanish Succession. Few great gardens existed in Liguria,



Examples of arboreal theaters in Tuscan villas of the baroque period, plans. *From left to right*: Garzoni; Gori; Marlia.

although that of the Villa Durazzo at Zerbino, designed by B. B. del Bianco, is notable. In the Veneto, landscape architects were active, especially in the Treviso district and along the Brenta River, between Venice and Padua. Longhena's Villa Lezze at Rovarè, now no longer in existence, was by all accounts a masterpiece. But the fame of the Venetian villas lies more in the buildings than their gardens. The main focal centers of mannerist and baroque landscape architecture were in Latium and Tuscany, where the greatest and most typical examples of the Italian style are found.

In the rest of Europe, the garden in the Italian style found the widest favor until Le Nôtre introduced a new style, which was to make the 18th an essentially French century. But the fundamentals of this transalpine landscape architecture had Italian roots. The gardens of Fontainebleau (PL. 436; FIG. 1093),

the Tuileries (PL. 438), and the Luxembourg were designed along Italian lines. Du Pérac, who designed Fontainebleau, studied for several years in Italy, and the Florentine Marie de Médicis, queen to Henry IV, was influential in introducing the Italian style, especially in the Luxembourg. It was from these models that Claude Mollet and Jacques Boyceau drew their inspiration. The Italian style was also successfully introduced into England; Hampton Court is the finest example of Italian landscape architecture in England (PL. 444). In Spain, the Italian style appears in the Royal Palace gardens of Aranjuez (PL. 443) and Buen Retiro in Madrid and in La Granja at Segovia (PL. 443; FIG. 1094); in Austria, in the Belvedere, Vienna (FIG. 1095); and in Russia, in the 18th-century Peterhof Gardens. Today, unfortunately, we know many gardens of this type only from figural sources.

André Le Nôtre, whom Louis XIV called "grand dans l'esprit," was a man of uncommonly wide culture. Born in 1613 of a family of gardeners, he studied painting with Vouet and architecture probably with Mansart. At the age of twenty-four he became general superintendent of the royal buildings. Le Nôtre's art had a decisive influence on landscape architecture in 18th-century Europe. Because of his contribution the garden in the French style became something more than a style; it became a fashion that lasted to the end of the *ancien régime*, a century after his death.

The cardinal points of Le Nôtre's landscape architecture are found in the Italian baroque. It could hardly have been otherwise, for the style of the great villas of Latium and Tuscany had established deep roots on French soil (although the style was noticeably altered owing to the flat terrain around the villas and châteaux of France). Le Nôtre realized, as had Bramante before him, that if a garden is not to appear lost in its surrounding space, it must be laid out along a well-defined axis. And, like Raphael, Le Nôtre understood that the main edifice must always be the central pivot of the design and the logical justification for the natural elements of the surrounding garden. On these 16th-century fundamentals, to which the 17th century had added a wealth of picturesque detail (sometimes even bizarre in character but always elegant in form), the French landscape architects based their style. Le Nôtre extended the composition and simplified it. His layout was arranged along well-defined contours and achieved carefully calculated effects. (It should always be borne in mind that, in order to study the ground plan of a garden, a mental reference to its perspective planes is necessary.) In Le Nôtre's style there are always two main points of view: looking from the main building to the farthest ends of the garden, and looking from the farthest point toward the building. Both these prospects must be free, yet at the same time the eye must be led toward interruptions

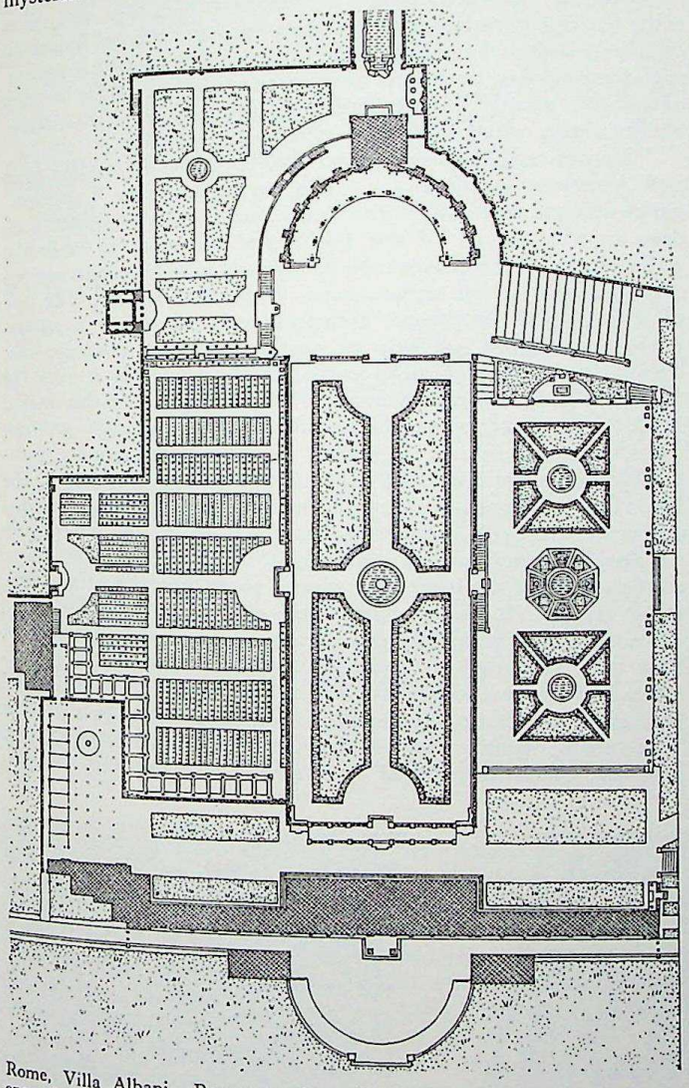
planned by the architect in the form of parterres of flowers or low shrubs planted along sinuous lines and enclosed within long rectangles. In some cases the straight lines of these rectangles may be broken by short and gentle curves. The geometric pattern of the parterres is emphasized by narrow strips of lawn placed along the sides. Yews and other trimmed shrubs, placed at stated intervals, align and articulate the line of sight, which with the help of carefully calculated perspective effects creates an illusion of space. The outer boundaries of the composition are denoted by masses of large trees, generally planes of great size, which further provide a transition to the surrounding landscape. Le Nôtre also used these trees to create mysterious shaded avenues, the *allées* of which he was so fond.

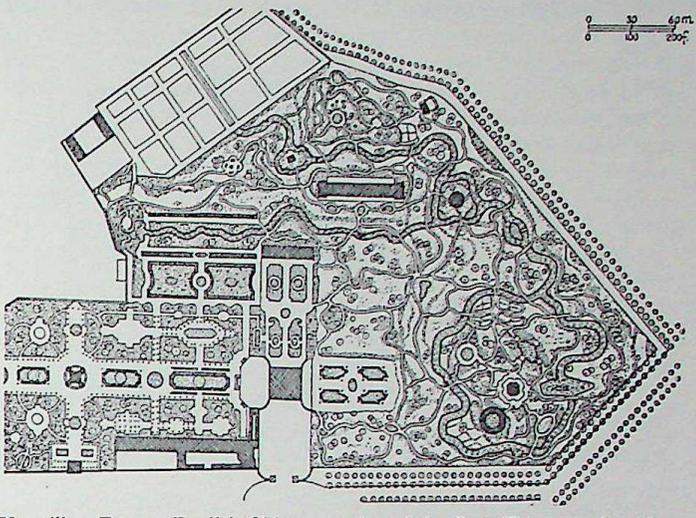


Rome, Villa Albani. Reconstruction of the plan, after an 18th-century engraving.

Water was another very important element; it had to be motionless, in vast expanses that reflected the changing lights of the sky, except for a few fountains where it gushed in short jets.

Le Nôtre's creations, from the gardens of Vaux (ca. 1655–61) to Versailles (FIG. 1098) and the Tuileries (PLS. 437, 438), constitute a series of masterpieces. In 1698 he was called to Turin to redesign the garden of the Royal Palace. Completed in 1700, the year of his death, this last creation of Le Nôtre's has, like Versailles, come down to us intact in its essential outlines.

From France, Le Nôtre's style soon spread to the rest of Europe. In Vienna, Schönbrunn Castle, begun by Fischer von Erlach in 1696 and finished by Paccassi in 1744, was surrounded by a vast and magnificent garden designed by Steckhoven and Von Hohenberg and laid out between 1753 and 1775. The design is based on the contraposition of two edifices, the castle and the Gloriette, separated by an enormous open space that slopes gently upward toward the latter building, filled with a series of parterres, terraces, and stairways. The style of Le Nôtre (who had been dead for half a century) was subjected



Versailles, France, English-Chinese garden of the Petit Trianon, plan (*from a project of C. Richard, 1774*).

to a good many modifications in Schönbrunn Castle, but it is still in evidence in the geometric layout of the parterres, in the relatively small number of trimmed shrubs, and in the great development of the arboreal frame that makes Schönbrunn more than a garden — rather an almost limitless park with a clearly defined transition from the luminous open spaces to the shadows of the forest. Schönbrunn represents a turning point in landscape architecture, not a single phenomenon; the stylistic change is complete and definitely established.

Decorative water works such as those of Vanvitelli's park of Caserta (PL. 441) constitute the main difference between the royal gardens of the Neapolitan Bourbons and of the Austrian Hapsburgs, which are contemporaneous. In Caserta there is also a close connection between natural elements (water, trees, lawns) and man-made elements (sculpture, hydraulics) — a fundamental characteristic of 18th-century landscape architecture.

A third type of 18th-century landscape architecture influenced by the French style is represented by the Villa Albani, on Via Salaria in Rome. The building was designed by C. Marchionni, who collaborated with A. Nelli in the plans for the garden. (PLS. 442, 445; FIG. 1097).

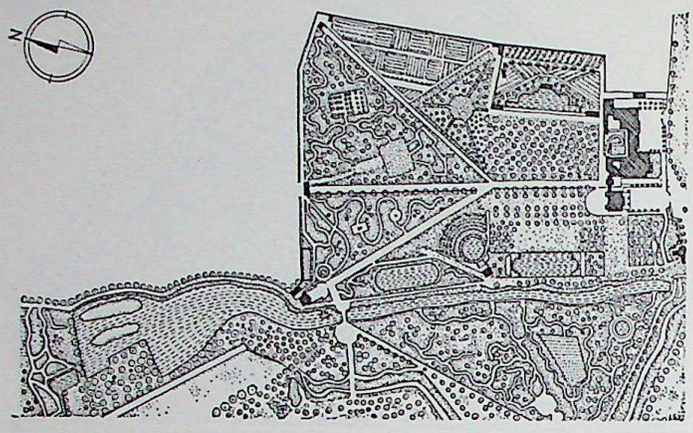
In England, the French style met with little success, although Charles II commissioned Le Nôtre to design the gardens at Greenwich and St. James Park. A new style of landscape architecture had its origins in this country, devised by William



Chiswick, near London, plan of the garden in its 18th-century state.

Kent (q.v.) and inspired by the writings of Alexander Pope. The principles were codified by a school of "landscape gardeners" headed by Capability Brown, who created the English garden that was so typical of the 19th century (FIGS. 1098, 1099). Essentially romantic in character, the English garden actually had origins that antedated the romantic movement, with which it was associated for almost half a century. By the last quarter of the 18th century the English garden had become a European phenomenon; a garden in this style was laid out by J. A. Graeffer in 1782 adjoining the park at Caserta, a stronghold of the baroque. Many new gardens were constructed in the English and neoclassic styles, and older gardens were adapted according to English dictates (PL. 444).

The basic tenet of English landscape architecture was a return to nature. But this was really an illusion, for never in the history of landscape architecture had gardens become so contrived, based on a spurious naturalism. Small lakes, temples, kiosks, and imitation ruins were hidden beneath the discreet shadows of great trees. The willow, because of its lonely and melancholy character, was a universal favorite. Twisting walks crossed elaborately laid-out lawns that were veritable carpets of mown grass of an intense green. The romantic garden went far beyond its technical premises, but precisely because of this it achieved a dreamlike beauty and a picturesque scenery of muted colors, shadows, and silence.

Roberto CARITÀ

The 19th and 20th centuries. In Europe, the English reaction against the formal garden brought a new style of landscape architecture in its wake. Gardens were no longer laid out along rigid geometric lines; they became places where man could be brought back to a love of nature free and unfettered by artificial decorative rules. This new direction was, to a great extent, stimulated by the principles of Oriental landscape architecture found in China and Japan. In these two countries, with their age-old traditions and innate enjoyment of the beauties of nature, gardens were conceived as a reflection of natural beauty, on a small scale and necessarily stylized.

The new style rapidly spread from England to the European and American continents. It can be seen in the "romantic" parks and gardens where the dominant note is complete freedom in the use of all the traditional elements of landscape architecture. Trees, lawns, hedges, lakes, and waterfalls assume a casual and, to all appearances, unplanned aspect. The aim of the English landscape architects was to create a natural environment with the help of nature itself — a tendency that became progressively more complicated, especially during the romantic period. New decorative details typical of this period made their appearance more and more frequently; artificial ruins, pagodas in an "Oriental" style, classic temples, Neo-Gothic constructions, and tropical and exotic plants gave the late 18th- and 19th-century garden a picturesque and unusual character (PL. 445). Landscape architects attempted to re-create the free and spontaneous atmosphere of a tropical forest, where a great variety of trees and plants grow in wild abundance. Great parks and gardens were laid out also in the expanding cities. Planned and planted with the greatest care and artifice, they were designed to resemble tracts of rural landscape enhanced by human ingenuity but always suited to the original geological structure of the site, as may be seen in the Villa Torlonia in Rome and at Ashridge Park in Hertfordshire, England, the latter planned and laid out by Humphry Repton.

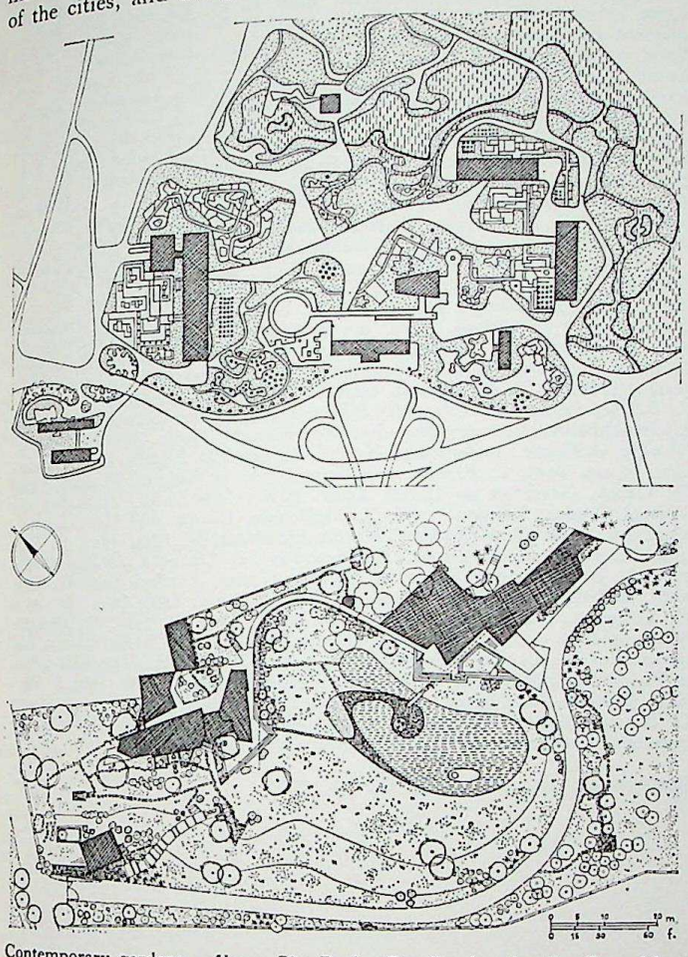
1101

By the end of the 19th century, however, three factors had spelled the end of this form of landscape architecture: movement of the population into urban areas, uncontrolled expansion of the cities, and the growth of great industrial areas. Moreover, many areas of ancient gardens were sacrificed to satisfy the exigencies of a mechanized and industrial age. In some cases they became public gardens. Today the concept of the private garden as the natural complement to structural architecture has all but vanished; overcrowded cities encroach more and more upon the few remaining green zones within the city limits, and only new legislation can halt the slow but inexorable disappearance of these zones. Apart from public gardens, often the remains of former private properties, only a few airless spaces between the great cement buildings are left. In Europe — particularly England, Sweden, and Holland — a movement has arisen that would enable man to live once again in contact with nature in so-called "garden cities" on the peripheries of the great metropolises. In the attempt to resolve the problem of incorporating green zones within modern urban areas, a radical and significant change in the spatial concepts of modern urban architecture has led to a search for a new, balanced relationship between man-made buildings and their natural ambience. These trends can be seen in the rational architecture recently developed in Sweden, Norway, Denmark, and Holland where influences of Oriental landscape-architectural principles are evident in the attempted fusion of the green of the surrounding external space with the internal spaces of the edifice by means of open architectural forms directly related to their natural environment. Terraces, inner courtyards, flower beds, and pools are among the means employed to bring nature into the dwellings of man. This unity between architecture and landscaping has freed the latter from every trace of traditional formalism. Gone are the avenues, the hedges and enclosures, fountains, statues, sculptural groups, and decorative constructions. An effect of natural wildness is created by pebbled walks, irregularly shaped pools evoking Oriental gardens, large aquatic plants, rocks, and exotic vegetation. Verandas and covered terraces open directly onto lawns, and trees and plants are surrounded by, and at times even inserted into, the buildings to emphasize the articulation and delimitation of the various areas and underline the spatial continuity inherent in modern architectural concepts. Among the most significant examples of this new style are the Savoye house at Poissy, designed by Le Corbusier; the apartment of Count Carlos de Beistegui on the Champs Elysées, Paris; and the garden of the UNESCO building in Paris, laid out by Isamu Noguchi.



Contemporary gardens. *Above*: São Paolo, Brazil, plan for the Exposition garden (*from the project of R. Burle Marx, 1953?*). *Below*: Camaiore, near Lucca, Italy, garden of a private villa, plan by A. Mazzoni (*from Domus, no. 326, 1957*).

In the past few years a new impulse in landscape architecture toward a style less apparently dependent on the architectural setting has come from R. Burle Marx (FIG. 1101; PL. 450), the chief exponent of the new tendencies. His work has aroused world-wide interest and drawn universal attention to the problems of modern landscape architecture. It is almost entirely confined to South America: Brazil (Hospital Sul America, Rio de Janeiro; Kronsfoth house, Teresopolis) and Venezuela (Parque del Este and Palacios house in Caracas). Burle Marx has achieved a very high degree of originality, particularly in the establishment of a chromatic relationship between the various zones of the garden. Somewhat influenced by Oriental concepts, especially in his use of isolated plants and the placement of stones, he has by careful selection and location of plants given new values to the various compositional elements of landscape architecture.
